Mr. Bayliss,
You will find attached the C-141 and the water analysis for the A-500 WDW. This is an injection well and there are many wells that dump into it. Produced water quality data from the well associated with or representative of the spill is attached. ARP Production Co., LLC (ARP) has found that in the Raton Basin CBM field, soil confirmation sampling no longer adds useful data on low volume acute releases of CBM produced water, as land uses and the environment are not impacted. Long term or negative effects to soil chemistry from low volume acute CBM produced water spills are generally surficial and benign, in that the water does not contain crude oil or liquid hydrocarbons; the TDS is significantly less than 10,000 mg/L; it is suitable for livestock watering, wildlife and in many cases surface discharge. Mixed with other water it is suitable for irrigation without impact. When requested by the agency or Vermejo Park Ranch ARP has and will collect soil samples. ARP requests closure of this incident based on this statement and attached water quality data.
Thank you
Randy
