

Release Cleanup Plan

DCP will determine the lateral and vertical extent of the contamination (hand augering and trenching). Once this has been determined contaminated soil will be excavated and transported to a NMOCD solid waste disposal facility. During excavation contaminated soil will be put on plastic awaiting disposal.

Confirmation samples will be collected and analyzed for BTEX and TPH. The values must be below BTEX and TPH cleanup criteria prescribed in *Guidelines for Remediation of Leaks, Spills, and Releases* (1993) authored by the New Mexico Oil Conservation Division and is a function of groundwater depth and distance to water wells and surface water bodies. If sample analyses show levels above cleanup criteria re-excavation and resampling will be performed.

A closure report will be prepared for review and will include a narrative of cleanup activities, analyticals, and a diagram of impacted area. After closure is approved the area will be backfilled to grade with clean soil and seeded.
