Hi Victoria,

In response to your questions about the Closure report:

1. The samples taken on 04/15/2020 and 05/08/2020 are different positions but labeled the same (with the side wall designation) due to their proximity for ease of reference. On 05/08/20 the sidewalls were advanced from the 04/15/2020 sample positions until the extent that the sidewalls were sampled below the OCD clean-up criteria.
2. I apologize for the confusion on site maps. This started out as a Cimarex job, therefore part of the site maps that were in the file were utilized, we also had a change in project manager. This ended up as an E.R.T. S. project as they were representing the party responsible for the release. Therefore I have attached a comprehensive final site excavation map for your records.
3. I have attached the site map depicting the areas of test trenching along with the corresponding lab report.
4. A final site map with background sample positions is attached along with the corresponding lab report.
5. There was variance to analyze for TPH only. This was determined by the initial sampling event on 08/07/2019, where Chlorides were ruled out as an analyte of concern with the exception of S-4 at 0 ft, where the Cl level was 688 mg/kg (the only exceedance for chlorides on the entire site, and it was excavated). So therefore chlorides were ruled out as an analyte of concern based on all the remaining sample results and not tested further.

Sorry for the confusion Victoria. Thank you for allowing us the opportunity to respond.

Respectfully submitted,

Rebecca Pons
