The elevation of the derrick floor above sea level is **3600** ft.

DETAILS OF WORK

(State names of and expected depths to objective sands; show sizes, weights, and lengths of proposed casings; indicate mudding jobs, cementing points, and all other important proposed work)

To increase production we propose to do the following work:

1. Perforate the Penrose formation from 3628'-3634' and 3653'-3662' with two jets per foot.
2. Run 3-inch tubing with hookball packer set at 3580'.
3. Acidize with 900 gallons of LST-NE 15% hydrochloric acid.
4. Fracture down 3-inch tubing with 10,000 gallons refined oil carrying one and one-half pounds of sand per gallon.
5. Recover load oil, test, and return well to production.

I understand that this plan of work must receive approval in writing by the Geological Survey before operations may be commenced.
