Gentlemen:

The above referenced well was drilled in late 1973. It was originally intended to be a Devonian test, however, at a total depth of 9,980 feet it was determined that, due to structural position, continued drilling to test the Devonian formation was not justified. At that point, casing was run and the well was completed in the Morrow formation for a Calculated Absolute Open Flow of 3,125 MCFPD.

Since the well is located 660' from the North and East lines of the Section, it is considered to be a non-standard gas unit. Since completion of the well, the north one-half of Section 5 has been consolidated by communitization, on file.

It is respectfully requested that administrative approval be granted to this non-standard gas unit as mentioned in Rule 104, C, II, (b).

Should additional information be required on the above subject, please advise.

Yours very truly,

COQUINA OIL CORPORATION
