## THEORY OF THE EARTH

The theory of the earth is a branch of geology which deals with the origin and development of the earth and its various parts. It is a science which seeks to explain the processes which have shaped the earth and its features, and to determine the time and place of their occurrence.

### THE EARTH AND ITS PARTS

The earth is a sphere, and its surface is divided into four main parts, or continents, which are the North America, South America, Europe, and Asia. These continents are separated by oceans, and the oceans are further divided into seas and bays. The earth is also divided into smaller parts, called islands and archipelagos, which are scattered throughout the oceans. The earth is covered by a thin layer of water, called the hydrosphere, and a thin layer of air, called the atmosphere. The earth is also covered by a thin layer of soil, called the lithosphere, which is the part of the earth that is solid and hard.
