	NORTI	HWEST NEWMEXICO	PACKER LEAKAGE	TEST INSTRUCTIO	NS			
 A packer leakage test shall be commenced on each multiply completed well within seven days after actual completion of the well, and annually thereafter as prescribed by the order authorizing the multiple completion. Such tests shall also be commenced on all multiple completions within seven days following recompletion and/or chemical or fracture treatment, and whenever remedial work has been done on a well during which the packer or the tubing have been disturbed. Tests shall also be taken at any time that communication is suspected or when requested by the Division. 				 Flow Test No. 2 shall be conducted even though no leak was indicated during Flow Test No. 1. Procedure for Flow Test No. 2 is to be the same as for Flow Test No. 1 except that the previously produced zone shall remain shut-in while the zone which was previously shut-in is produced. Pressures for gas-zone tests must be measured on each zone with a deadweight pressure gauge at time intervals as follows: 3 hours tests: immediately prior to the beginning of each flow period, at fifteen-minute 				
 At least 72 hours prior to the commencement of any packer leakage test, the operator shall notify the Division in writing of the exact time the test is to be commenced. Offset operators shall also be so notified. The packer leakage test shall commence when both zones of the dual completion are shut-in for pressure stabilization. Both zones shall remain shut-in until the well-head pressure in each has stabilized, provided however, that they need not remain shut-in more than seven days. 				intervals during the first hour thereof, and at hourly intervals thereafter, including one pressure measurement immediately prior to the conclusion of each flow period. 7-day tests: immediately prior to the beginning of each flow period, at least one time during each flow period (at approximately the midway point) and immediately prior to the conclusion of each flow period. Other pressures may be taken as desired, or may be requested on wells which have previously shown questionable test data. 24-hour oil zone tests: all pressures, throughout the entire test, shall be continuously measured and recorded with recording pressure gauges the accuracy of which must be checked at least twice, once at the beginning and once at the end of each test, with a deadweight pressure gauge. If a well is a gas-oil or an oil-gas dual completion, the recording gauge shall be required on the oil zone only, with deadweight pressures as required above being taken on the gas zone.				
 For Flow Test No. 1, one zone of the while the other zone remains shut-in. Suc 24 hours in the case of an oil well. Note: atmosphere due to lack of a pipeline connertication. 	h test shall be continued for seven days if, on an initial packer leakage test, a g	in the case of a gas well and as well is being flowed to the	d for e 8. The res test. Tests s Northwest N	hall be filed with the Aztec lew Mexico Packer Leakag	c District Office of the M ge Test Form Revised 1	triplicate within 15 days after completion of the New Mexico Oil Conservation Division on 10-01-78 with all deadweight pressures indicated and gravity and GOR (oil zones only).		
 Following completion of Flow Test N above. 	No. 1, the well shall again be shut-in, in	accordance with Paragraph	3
