ConocoPhillips PATTERSON 3 Expense - P&A

Lat 36° 55' 23.592" N

Long 108°4' 4.728" W

PROCEDURE

This project requires a NMOCD C-144 CLEZ Closed-Loop System Permit for the use of an A-Plus steel tank to handle waste fluids circulated from the well and cement wash up.

1. Hold pre-job safety meeting. Comply with all NMOCD, BLM, and COPC safety and environmental regulations. Test rig anchors prior to moving in rig.

2, MIRU workover rig. Check casing, tubing, and bradenhead pressures and record them in Wellview.

3. When an existing primary valve (i.e. casing valve) is to be used, the existing piping should be removed and replaced with the appropriate piping for the intended operation.

4. RU blow lines from casing valves and begin blowing down casing pressure. Kill well with water, as necessary, and at least pump tubing capacity of water down tubing.

5. ND wellhead and NU BOPE. Pressure and function test BOP. PU and remove tubing hanger.

6. TOOH with 1" tubing and lay down.

Tubing:	Yes	Size:	1"	Length:	2737
---------	-----	-------	----	---------	------

7. PU 2-3/8" EUE workstring and TIH with a watermolen mill for 4-1/2" 9.5# J-55 casing to 2738' or as deep as posible.

8. PU and RIH with CR for 4-1/2" 9.5# J-55 casing and set 50' above top perforation at 2688'. POOH.

9. Load 4-1/2" casing, pressure test tubing to 1000 psi and pressure test casing to 800 psi. Hold 500 psi of pressure on 4-1/2" casing and run CBL. Contact Production Engineer with results.

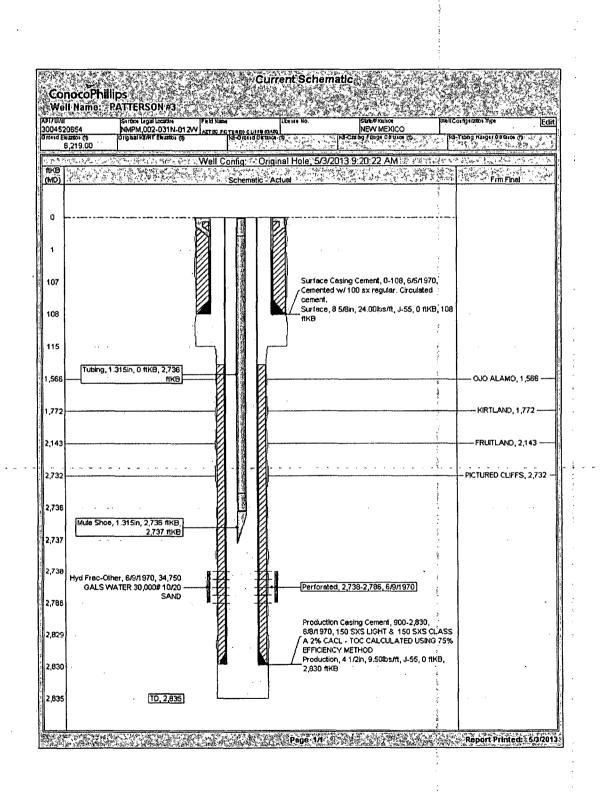

All cement volumes use 100% excess outside pipe and 50° excess inside pipe. The stabilizing wellbore fluid will be 8.3 ppg, sufficient to balance all exposed formation pressures. All cement will be ASTM Type II mixed at 15.6 ppg with a 1.18 cf/sk yield.

10. Plug 1 (Pictured Cliffs Perforations and Formation Top , 2588-2688', 12 Sacks Class B Cement) Note: CR for 4-1/2" 9.5# J-55 casing is already set at 2688'. Load casing and circulate clean. Mix 12 sx of Class B cement and spot plug inside casing to isolate the Pictured Cliffs Formation Top. PUH.

11. Plug 2 (Fruitland, Kirtland and Ojo Alamo Formation Tops, 1516-2193', 57 Sacks Class B Cement) Mix 57 sx Class B cement and spot balance plug inside casing to isolate the Fruitland Coal, Kirtland and Ojo Alamo Formation Tops.

12. Plug 3 (Surfae Casing Shoe and Surface Plug, 0-158', 62 Sacks Class B Cement) Perforate 3 HSC holes at 158'. Establish injection rate into squeeze holes, circulate out the bradenhead valve with water, and circulate the bradenhead annulus clean. Mix 62 sx Class B cement and pump down the production casing to circulate good cement out the bradenhead to isolate the Surface Casing Shoe. Shut in well and WOC.

13. Nipple down BOP and cut off casing below the casing flange. Install P&A marker with cement to comply with regulations. Rig down, move off location, cut off anchors, and restore location.
