NMOCD	R

(CO)D

ConocoPhillips HANKS 14E WO - Commingles

Lat 36° 35' 3.948" N

Long 107° 50' 33.756'' W

PROCEDURE

1. Hold pre-job safety meeting. Comply with all NMOCD, BLM, and COPC safety and environmental regulations. Test rig anchors prior to moving in rig.

2. MIRU work over rig. Check casing, tubing, and bradenhead pressures and record them in Wellview. If there is pressure on the BH, contact Wells Engineer.

3. RU blow lines from casing valves and begin blowing down casing pressure. Kill well with 2% KCI as necessary.

4. ND wellhead. Set 2-way check in long string. NU BOPE with offset spool and offset 1 1/2" pipe rams. Pressure and function test BOP to 200-300 psi low and 1000 psi over SICP up to a max of 2000 psi as per COP Well Control Manual. PU and remove tubing hanger.

5. POOH and LD Pictured Cliffs 1-1/2" IJ tubing (per pertinent data sheet). Visually inspect tubing and make note of corrosion, scale, or paraffin and record in WellView.

6. ND offset spool and offset 1 1/2" pipe rams. Remove 2-way check. Install regular 1 1/2" pipe rams.

7. PU on tubing hanger. POOH and LD Dakota 1-1/2" IJ tubing (per pertinent data sheet). Release Otis Permalach packer by picking up with a little weight, rotate quarter turn to the right, pick up 12 inches and allow to equalize. If packer will not come free, cut the 1-1/2" tubing above the packer and fish with overshot and jars. LD 2 joints, land hanger with crossovers, and pressure test pipe rams. Visually inspect tubing and make note of corrosion, scale, or paraffin and record in WellView.

8. Change out 1 1/2" pipe rams to 2 3/8" pipe rams and pressure test the 2 3/8" pipe rams.

9. PU 4-3/4" string mill and bit with 2 3/8" tubing and CO to PBTD @ 6646' using the air package. TOOH and LD string mill and bit. Record fill depth in WellView. If fill could not be CO to PBTD, call Wells Engineer to inform how much fill was left and confirm/adjust landing depth.

10. TIH with 2-3/8" production tubing using tubing drift procedure (detail below).

		Tubing and BHA Description		
Tubing Drift ID:	1.901"	1	2-3/8" Expendable Check	
		1	2-3/8" (1.78" ID) F Nipple	
Land Tubing At:	6550'	1	2-3/8" Tubing Joint	
KB:	12'	1	2-3/8" Pup Joint	
		~209	2-3/8" Tubing Joints	
		as needed	2-3/8" Pup Joints for spacing	
		1	2-3/8" Tubing Joint	

11. ND BOPE, NU Wellhead. Pressure test tubing slowly with an air package as follows: pump 3 bbls pad, drop steel ball, pressure tubing up to 500 psi, and bypass air. Monitor pressure for 15 mins., then complete the operation by pumping off the expendable check. Note in Wellview the pressure in which the check pumped off. Notify the MSO that the well is ready to be turned over to Production Operations. Make swab run to kick-off the well, if necessary, then RDMO.

Tubing Drift Check

......

.

PROCEDURE

1. Set flow control in tubing. With air on location, use expendable check.

2. RU drift tool to a minimum 70' line. Drift tool will have an OD of at least the API drift specification of 1.901" for the 2 3/8",4.7# tubing, and will be at least 15" long. The tool will not weigh more than 10# and will have an ID bore the length of the tool, so fluids may be pumped through the tool if it becomes stuck.

3. Drop the tool into the tubing string and retrieve it after every 2 joints of tubing ran in hole. If any resistance to the tool movement is noticed, going in or out, that joint will be replaced.

In order to stimulate the plunger lift operation, all equipment must be kept clean and free of debris. The drift tool should be measured with calipers before each job, to ensure the OD is the correct size for the tubing being checked. The maximum allowable wear of the tool is .003".
