Additional data for EC transaction #315048 that would not fit on the form

32. Additional remarks, continued

RIH w/ 5-1/2" test pkr. RIH to 1875' - good tool test, 500psi to verify RBP holding. Release pker and isolate csg leak between 1176' - 1208'. No communication with surface csg during test. POOH w/ test pkr. SWIFN.

Note: Brandon Powell with NMOCD was notified via voice message on intent to pump cement. NOI

Sundry approved - April Pohl.

8/22/2015

RIH w/ notched collar on 2-3/8" workstring to 1875' & circulate out 60bbls wellbore fluid with air (calculated hole vol = 52bbls). POOH with workstring.

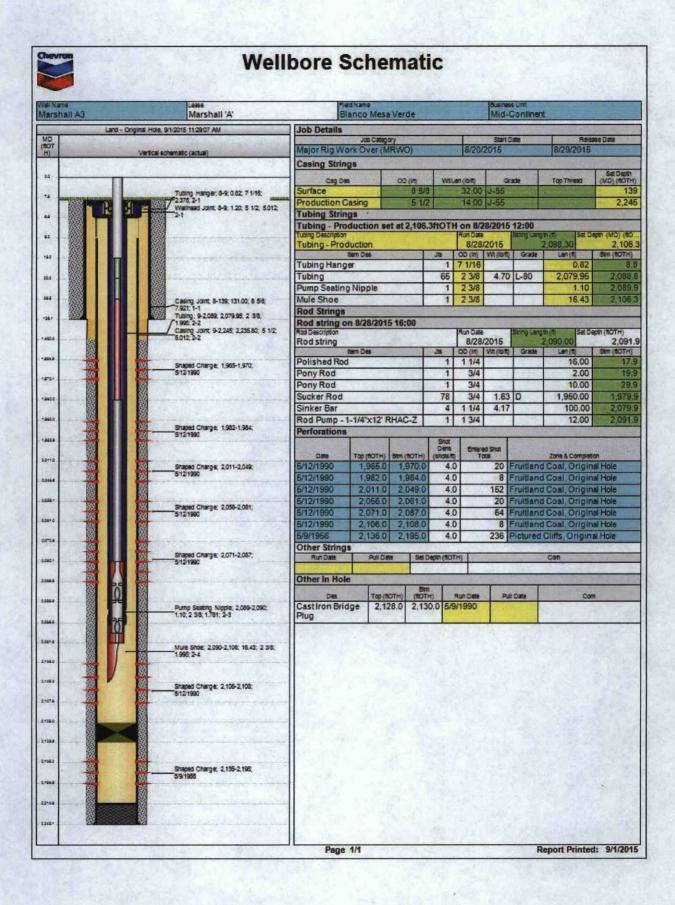

R/U wireline w down hole camera (side view & down view). RIH to 155' & tag fluid level. Wellbore filled 50bbls in 1hr from influx. Pumped 2% KCI @ 1-2BPM, 500-700psi. RIH w/camera, recorded images with limited resolution - only side view was operational. Continue to RIH while pumping clear fluid (every time pump shuts down influx clouds images). Cloudy fluid at 1174' down unable to record images. Appears as if clear fluid is exiting wellbore beginning at 1174'. POOH w/camera. Pumped total of 85bbls

Images showed minor pitting from 1168' to darkness at 1174', otherwise images from 1168' to 500' looked like good csg."

RIH w/ CCL to 1905'. Record collar log to surface. Clean collars detected throughout wellbore -no distortion from 1174' to 1905'.

PLEASE SEE ATTACHED FOR REMAINDER OF REPORT

OIL COMS. DIV DIST, 3

8/23/2015

RIH w/ notched collar to 1875' & spot 20gal sand on top of RBP @1905'. POOH w/ notched collar.

RIH w/ 5-1/2" pkr w/unloader & set @987'. Pressure test 5-1/2" csg to 500psi for 5min - good. Bled back to 100psi & left pressure trapped on annulus to monitor.

R/U cementing crew. Pressure test lines to 3000psi set max pressure for job at 1500psi. Establish injection rate of 2BPM 850psi w/ 5bbls fresh water. Mix class 'G' neat cement at 15.8ppg, pumping @1BPM 500psi. After 6bbls pumped, pressure on 8-5/8' surface csg upe to 200psi. No communication w/ 5-1/2". Open surface csg to returns tank, circulating out black water. Continue pumping 15.8ppg cement @2BPM & pressure down to 350psi. Returns became more viscous, bringing back heavy drilling mud, pump pressure increased to 1500psi, lost returns after 48bbls cement pumped. Cement/thick mud interface plugged off at wellhead.

R/D cementers, leave 680psi on tbg, 200psi on 5-1/2", 40psi on 8-5/8". SWIFN.

Attempt to pump displacement, reached max pressure of 1500psi. Bled off pressure & opened unloader on pkr, let pressure equalize & release pkr - no flow from formation. Reverse out 4bbls cement w/ 2% KCl until clean & pull 2 stands. Reverse with additional 20bbls 2% KCl, saw no cement, returns clean KCl water. Reset pkr @925'. Broke off returns line on 8-5/8" and found cement packed off in valve & fittings (cement to surface). Pressure up with cementers to 700psi down tbg with no fluid movement & monitor for 30min - lost 20psi, pressure on 8-5/8" 40psi, no communication with 5-1/2".

Release pkr, pressure tested 5-1/2" csg from surface to cement top (977') to 500psi for 30min - no leak off. Lay down pkr. P/U & RIH w/ 4-3/4" bit, four 3-1/8" collars, on 2-3/8" workstring. RIH & tag TOC @977'. R/U swivel.

Break circ, drill very hard cement 977' to 1134' at a consistent rate of 30ft/hr. Circulate clean, R/D swivel. Pull 2jts & SWIFN. 8/25/2015

Open surface csg - no fluid flow. R/U swivel, RIH to 1134', continue drilling hard cement. Drill to 1193', fell through. R/D swivel, RIH to sand top at 1875'. POOH w/ bit.

R/U wireline unit. RIH w/ CBL tool. Tag top of sand @1875' & record bond to surface. Showed original TOC @1475' & bottom of squeeze cement @1220'. Good bond to surface. R/D cementers.

R/U chart recorder & pressure test 5-1/2" csg from 1875' to surface to 500psi for 30min. Lost 20psi gradually over 30 min. Install hanger & test BOP's to 250/2100psi low/high. All valves, pipe, blinds & annular to 1500psi, good. R/D BOP tester, remove hanger. SWIFN.

8/26/2015

8/24/2015

Spot in & R/U chart recorder. Perform MIT with John Durham (NMOCD) as witness. Pressure up 5-1/2" csg to 680psi & record pressure for 30min. No leak off, good test. R/D chart recorder.

RIH w/ retrieving head to 1875' (sand top) & circulate sand off of RBP @1905'. Engage RBP & release plug. Check pressures, hole standing full. POOH & lay down RBP.

P/U & RIH w/ 6jts 2-3/8" workstring, 10ft pup, 5-1/2" pkr. RIH to 1905' & set pkr (end of tailpipe @2098').

Pressure test annulus to 500psi - good. Pump 10bbls down tbg @3.5BPM 600psi. Wait for acid to arrive on location. Spot in & R/U acid pump, transport, lines. Pressure test lines to 3000psi. Establish injection rate of 4BPM 800psi w/ 10bbls 2% KCl (took 5bbls to fill). Switch to acid & pump 2000gal 15% HCl w/ additives @4BPM 800psi & flush to end of tailpipe w/ 8bbls 2% KCl. Let soak for 30min. Flush with additional 20bbls 2% KCl @ 4BPM 500psi. ISIP 200psi. R/D acid crew. SWIFN.

8/27/2015

Opened up well. Release pkr @1905' & POOH. RIH w/ 4-3/4" bit on 2-3/8" workstring. RIH to 2088' & R/U swivel. Break circulation with air unit, continue in hole. Tag fill @2110' & clean out to CIBP @2128'. Fill was soft, mushy. Returns were mud/silt consistency, cleaned quickly. Air unit pumping 8-10 bbl/hr, 1gal per 20bbl corrosion inhibitor, foamer, oxygen scavenger. Pump pressure +/-250psi. Circulate clean, continue circulating bringing back slugs of fluid. Recovered 75bbls in 5hrs. Cut air, pull above perfs to 1875'. SWIFN.

8/28/2015

Opened up well. RIH & tag CIBP @2128', no fill. POOH 2-3/8" workstring.

Transfer 68jts Yellow band 2-3/8", tally. P/U & RIH w/SN on 65jts 2-3/8". land prod tbg with EOT @2098', SN @2089'.

R/D floor & handling equipment. N/D BOP's, N/U wellhead. R/U rod handling equipment.

RIH w/new rod pump 1-1/4"x12' RHAC-Z on 3/4" rod string 79 rods. Seat pump, test tbg 500psi - good. Pump action-good. SWIFN.

8/29/2015 RDMO
