		THWEST NEWMEXICO	PACKER LEAKAGE	E TEST INSTRUCTIO	ONS		
<ol> <li>A packer leakage test shall be comp completion of the well, and annually then Such tests shall also be commenced on a chemical or fracture treatment, and when the tubing have been disturbed. Tests sh</li> </ol>	Il multiple completions within seven da never remedial work has been done on a	rizing the multiple completion ys following recompletion an a well during which the packe	d/or remain shut- r or	st No. 2 is to be the same		cated during Flow Test No. 1. Procedure at the previously produced zone shall	
rec I by the Division.	and any or taken at any time that contin	and a suspected of whe	7. Pressur			a deadweight pressure gauge at time f each flow period, at fifteen-minute	
<ol> <li>At least 72 hours prior to the comm Division in writing of the exact time the</li> </ol>	nencement of any packer leakage test, t test is to be commenced. Offset operat		intervals dur immediately flow period, to the conclu	ing the first hour thereof, prior to the conclusion o at least one time during of	and at hourly intervals thereafter, f each flow period. 7-day tests: in each flow period (at approximatel Other pressures may be taken as	including one pressure measurement nmediately prior to the beginning of each y the midway point) and immediately prior is desired, or may be requested on wells	
<ol> <li>The packer leakage test shall comm</li> </ol>	nence when both zones of the dual com	pletion are shut-in for pressur	24-hou	r oil zone tests: all pressu	res, throughout the entire test, sh	all be continuously measured and recorde at least twice, once at the beginning and	

3. The packer leakage test shall commence when both zones of the dual completion are shut-in for pressure stabilization. Both zones shall remain shut-in until the well-head pressure in each has stabilized, provided however, that they need not remain shut-in more than seven days.

\*

4. For Flow Test No. 1, one zone of the dual completion shall be produced at the normal rate of production while the other zone remains shut-in. Such test shall be continued for seven days in the case of a gas well and for 24 hours in the case of an oil well. Note: if, on an initial packer leakage test, a gas well is being flowed to the atmosphere due to lack of a pipeline connection the flow period shall be three hours.

5. Following completion of Flow Test No. 1, the well shall again be shut-in, in accordance with Paragraph 3 above.

24-nour ou zone tests: an pressures, throughout the entire test, snal be continuously measured and recorded with recording pressure gauges the accuracy of which must be checked at least twice, once at the beginning and once at the end of each test, with a deadweight pressure gauge. If a well is a gas-oil or an oil-gas dual completion, the recording gauge shall be required on the oil zone only, with deadweight pressures as required above being taken on the gas zone.

8. The results of the above-described tests shall be filed in triplicate within 15 days after completion of the test. Tests shall be filed with the Aztec District Office of the New Mexico Oil Conservation Division on Northwest New Mexico Packer Leakage Test Form Revised 10-01-78 with all deadweight pressures indicated thereon as well as the flowing temperatures (gas zones only) and gravity and GOR (oil zones only).
