	NORT	HWEST NEWMEXICO P	PACKER LEAKAGE	TEST INSTRUCTIO	NS	
	menced on each multiply completed well creafter as prescribed by the order author					is indicated during Flow Test No. 1. Procedure epi that the previously produced zone shall
Such tests shall also be commenced on chemical or fracture treatment, and whe	all multiple completions within seven day enever remedial work has been done on a	s following recompletion and/o well during which the packer o	or remain shut-i		as previously shut-in is pro	
the tubing have been disturbed. Tests s requested by the Division.	hall also be taken at any time that commu	unication is suspected or when				with a deadweight pressure gauge at time
2			intervals duri	ing the first hour thereof, a	and at hourly intervals ther	ning of each flow period, at fifteen-minute eafter, including one pressure measurement
	mencement of any packer leakage test, the test is to be commenced. Offset operated		flow period,	at least one time during ea	ch flow period (at approx	ests: immediately prior to the beginning of each imately the midway point) and immediately prior ken as desired, or may be requested on wells
				reviously shown question		ken as uesneu, or may be requested on wells

24-hour oil zone tests: all pressures, throughout the entire test, shall be continuously measured and recorded with recording pressure gauges the accuracy of which must be checked at least twice, once at the beginning and once at the end of each test, with a deadweight pressure gauge. If a well is a gas-oil or an oil-gas dual completion, the recording gauge shall be required on the oil zone only, with deadweight pressures as required above being taken on the gas zone.

8. The results of the above-described tests shall be filed in triplicate within 15 days after completion of the test. Tests shall be filed with the Aztec District Office of the New Mexico Oil Conservation Division on Northwest New Mexico Packer Leakage Test Form Revised 10-01-78 with all deadweight pressures indicated thereon as well as the flowing temperatures (gas zones only) and gravity and GOR (oil zones only).

5. Following completion of Flow Test No. 1, the well shall again be shut-in, in accordance with Paragraph 3 above.

The packer leakage test shall commence when both zones of the dual completion are shut-in for pressure

4. For Flow Test No. 1, one zone of the dual completion shall be produced at the normal rate of production while the other zone remains shut-in. Such test shall be continued for seven days in the case of a gas well and for

24 hours in the case of an oil well. Note: if, on an initial packer leakage test, a gas well is being flowed to the

atmosphere due to lack of a pipeline connection the flow period shall be three hours.

stabilization. Both zones shall remain shut-in until the well-head pressure in each has stabilized, provided however, that they need not remain shut-in more than seven days.

3.
