December 4, 1986

Request permission to temporarily abandon above referenced well. The cumulative production from this well totaled 3,886 bbls of oil prior to excessive water encroachment. Oil production could be restored by the installation of downhole redi pump so that large quantities of fluid could be handled. However, such an operation is costly and cannot be justified at current crude oil prices. Additionally, there are other formations behind the pipe in subject well that might prove productive, but current crude oil prices do not justify additional expenditures required to test these zones. Plugging the well at this time would result in the loss of these reserves for all time, and the obvious loss of royalty income to the Federal Government.

Casing in subject well is sound and no contamination of other formations is contemplated.

Operator has determined that all wells in its Franciscan Mesa Verde Field, of which subject well is a part, cannot be economically operated at current crude oil prices, and will make application immediately for suspension of producing requirements.

This Approval or Temporary
Abandonment Expires 12/5/87
