### NORTHWEST NEW MEXICO PACKER LEAKAGE TEST INSTRUCTIONS

- 1. A packer leakage test shall be commenced on each multiply completed well within seven days after actual completion of the well, and annually thereafter as prescribed by the order authorizing the multiple completion. Such tests shall also be commenced on all multiple completions within seven days following recompletion and/or chemical or fracture uncarment, and whenever remedial work has been done on a well during which the packer or the tubing have been durunbed. Tests shall also be taken at any time that communication is nutrected or when requested by the Division.
- 2. At least 72 hours prior to the commencement of any packer leakage test, the operator shall modify the Division in writing of the exact tunic the test is to be commenced. Offset operators shall also be so notified.
- 3 The packet leakage test shall commence when both zones of the dual completion are shut-in for pressure stabilisation. Both zones shall termain shut-in until the well-head pressure in each has stabilised, provided however, that they need not termain shut-in more than seven days.
- 4. For Flow Ten No. 1, one zone of the dual completion shall be produced at the normal rate of production while the other zone remains shut-in. Such ten shall be continued for seven days in the case of a par well and for 24 hours in the case of an oil well. Note: if, on an initial packer leakage tent, a par well is being flowed to the authorphere due to the lack of a pipeline connection the flow period shall be three hours.
- 3. Following completion of Flow Test No. 1, the well shall again be shut-in, in accordance with Faragraph 3 shove.
- C. Fire Test No. 2 shall be conducted even though no leak was indicated during Flow. Test No. 1. From John Form Test No. 2 is to be the same at the Firem Test No. 1 except.

- that the previously produced zone shall remain shut-in while the zone which was prely shut-in is produced.
- 7. Pressures for gas-zone tests must be measured on each zone with a deadwaster gauge at time intervals as follows: 3 hours tests: immediately prior to the being of each flow-period, at fifteen-minute intervals during the first hour thereof, a hourly intervals thereafter, including one pressure measurement immediately prior conclusion of each flow period. 7-day tests: immediately prior to the beginning of flow period, at fram one time during each flow period (at approximately the mipoint) and immediately prior to the conclusion of each flow period. Other pressure be taken as desired, or may be requested on wells which have previously shown

24-hour oil zone texu: all pressures, throughout the entire text, shall be continued and recorded with recording pressure gauges the accuracy of which measured and recorded with recording pressure gauges the accuracy of which methed at least twice, once at the beginning and once at the end of each text, deadweight pressure gauge. If a well is a gas-oil or an oil-gas dual completion, the sing gauge shall be required on the oil zone only, with deadweight pressures as recorded being taken on the gas zone.

E. The results of the above-described tests shall be filled in triplicate within 15 day completion of the test. Tests shall be filled with the Azter District Office of the New Oil Conservation Division on Northwest New Mexico Parker Leskage Test Form E. 10-01-75 with all deadweight pressures indicated thereon as well as the filtemperatures (gas zones only) and gravin and GOR (oil zones only).
