Abstract. The purpose of this study was to determine whether there were differences in the prevalence of periodontitis between patients who had been treated by a general dentist or a periodontist. A total of 60 patients were selected from two dental practices. All patients had been referred to the same periodontal specialist. The patients were divided into two groups based on their previous treatment: those who had been treated by a general dentist and those who had been treated by a periodontist. The results showed that there were no significant differences in the prevalence of periodontitis between the two groups. This suggests that the quality of periodontal care provided by a general dentist can be comparable to that provided by a periodontist.
