DETAILS OF WORK

(State names of and expected depths to objective sands; show sizes, weights, and lengths of proposed casings; indicate mudding jobs, cementing points, and all other important proposed work)

On May 27, 1955 this well was observed to be producing a stream of water from the production casing. Consequently, the well was plugged as follows:
100 sacks regular cement was mixed and pumped down the casing.
Maximum pressure was 1500 psi, the well was shut in for 12 hours.
Top of the cement was found at 92'. Three joints of tubing was run in and cement was circulated to the surface. Cement was set 24 hours. No water or gas production was noted.

I understand that this plan of work must receive approval in writing by the Geological Survey before operations may be commenced.
