## NORTHWET NEW MEDICO PACKER LEAKAGE TEST METRUCTIONS

- 1. A packer leakage test shall be commenced on each studgely complised well within seven days after actual completion of the well, and anapaly thinsales as feestribed by the order authorizing the multiple completion. Such test shall also be expanded on attempte completions within seven days following receipspleting and for themsels or statute treasment, and whenever remedial work has been done in a well during which the packer or the tubing have been disturbed. Tests shall the be these at any time that communication is suspected or when requested by the Dibbids.

  2. At least 72 hours print to the content of the content of the state of the content of the cont
- 2. At least 72 hours prior to the commencement of any macher lestage test, the operator shall notify the Division in writing of the exact time the test is to be commenced. Offset operators shall also be so notified.
- 3 The packer leakage test shall commence when both zones of the dud completion are shut-in for pressure stabilization. Both zones shall atting that in until the will-head pressure in each has stabilized, provided however, that they night she senting shut-in more than seven days.
- 4 For Prov Test No. 1, one zone of the dual completion shall be produced at the normal rate of production while the other zone remains thur in. Such any shall be convinued for seven days to the case of a gas well and for 24 hours in the case of n oil fiell. Note: if, on an initial patter leakage test, a gas well is being flowed to the test of a pipeline connection the flow period shall be three hours.
- 5. Following completion of Flow Test No. 1, the wall shall again be thut-in, in accordance with Paragraph 3 above.
- 6. Flow Test No. 2 shall be conducted even though no leak wa insigned during Flow Test No. 1. Procedure for Flow Test No. 2 is to be the inside to fulfillow Yest No. 1 except

that the previously and used some shall remain shut-in while the zone which was previously abut-in is produced.

7. Pressures for impanent term must be measured on each zone with a deadweight pressure gauge at that intervals as follows: 3 hours tests: immediately prior to the beginning of each flow-dised, at faforen-minum intervals during the first hour thereof, and at hourly intervals all authors, including one pressure measurement immediately prior to the conclusion of each flow period, 7-day tests: immediately prior to the beginning of each flow period, at later one time during each flow period (at approximately the midway point) and immediately prior to the conclusion of each flow period. Other pressures may be taken as desirable, at may be requested on wells which have previously shown questionable and desirable.

be taken as desires, or may we requesses on tionable test data;

24-hour oil active tests: all pressures, throughout the entire test, shall be continuously measured and redicided with recording pressure gauges the accuracy of which must be checked at least dise, once at the beginning and once at the end of each test, with a deadweight pressure gauge. If a well is a gas-oil or an oil-gas dual completion, the recording gauge shall indicapated on the oil zone only, with deadweight pressures as required above being takenish the gas zone.

above being taked the gas zone.

8. The results of the above-described tests shall be filed in triplicate within 15 days after completion of the last. Term shall be filed with the Aztec District Office of the New Mexico Oil Conservation distains on Morthwest New Mexico Packer Leakage Test Form Revised 10-01-78 with a deadweight pressures indicated thereon as well as the flowing , temperatures (gas subes only) and graviny and GOR (oil zones only).
