NORTHWEST NEW MEXICO PACKER LEAKAGE TEST INSTRUCTIONS

- A pacture tealings test shall be occurrenced on each multiply completed well within seven days after
 actual competion of the well, and amountly thereafter as prescribed by the order authorizing the
 multiple competions. Such tests shall also be commented on all multiple completions within seven days
 following recomplations unifor chemical or fune-same treatment, and whosever remedial work has been
 done on a well during which the proton or the tubing have been disturbed. Tosts shall also be taken at
 any time that communication in suspected or whan requested by the Division.
 At least 72 hours prior to the communication of any proton lealings test, the operator shall motify
- At least 72 hours prior to the communication of any paoter leakage test, the operator shall notify the Division is writing of the exact time the test is to be communical. Offset operators shall also be no notified.
- 3. The pacter images test shall commence when both somes of the shall completion are shad-in for pressure stabilization. both somes shall remain about in most the well-head pressure in each less stabilized, provided however, that they need not remain shad-in more than goven days.
- 4. For flow Test No. 1, can gone of the dual completion shall be produced at the moment sets of production while the other zone scenaries sine-in. Such test shall be consistent for seven days if the case of a gas well and for 24 hours in the case of an oil well. Note: if on an initial packer isolarge test, a gas well is being flowed as the atmosphere due to the lack of a pipeline connection the flow period shall be three hours.
- 5. Following completion of flow Test No. 1, the well shall again to abstr-in, in accordance with Paragraph 3 above.
- Flow Test No. 2 shall be constanted even though no leak was indicated during flow Test No. 1.
 Procedure for Flow Test No. 2 is to be the same as for Flow Test No. 1

- of on such multiply completed well within seven days after except that the previously produced zone shall remain shat-in while the zone which the same which the previously shat-in is previously.
 - 7. Pressures for gas-scene tests must be measured on each zone with a deadweight pressure gauge at time intervals as follows: 3 hours tests: immediately price to the beginning of each flow-period, at fifteen minute intervals during the first hour thereof, and at hourly intervals thereafter, including one pressure measurement immediately prior to the flow period, at least one time during each flow period (at approximately the midway point) and immediately prior to the conclusion of each flow period. Other pressures may be taken as desired, or may be requested on wells which have proviously shown questionable test date.
 - 24-hour oil zone tests: all pressures, throughout the entire test, shall be continuously measured and recorded with recording pressure gauges the accessory of which must be choched at least twice, came at the beginning and once at the end of each test, with a dendweight pressure gauge. If a wall is a gen-oil or an oil-gas shall completion, the recording gauge shall be measured on the oil zone only, with dendweight pressures as required above being taken on the gat zone.
 - 8. The results of the above described tests shall be filed in triplicate within 15 days after completion of the test. Tests shall be filed with the Asteo District Office of the New Mexico Oil Conservation Division of Northwest New Mexico Packer Lealings Test form Revised 10/01/78 with all deadweight pressures indicated thereon as test as the flowing temperatures (gas zones only) and gravity and GOR (oil zones only).
