1. A packer lenkage t	en shall be commenced		EW NEXCO PACKEI				. i131-	ne which was previou	

- ren dave after actual completion of the well, and annually thereafter as prescribed by the order authorizing the multiple completion. Such tests shall also be consumenced on all multiple completions within seven days following recompletion and/or chemical or fracture treatment, and whenever temedial work has been done on a well during which the packer or the rubing have been distrurbed. Tests shall also be taken at any since that communication is suspected or when requested by the Division.
- 2. At least 72 hours prior to the commencement of any packer leakage test, the operator shall notify the Division in writing of the exact time the test is to be commenced. Office operators thall also be so notified.
- 3. The packer leakage test shall commence when both zones of the dual completion are shut-in for pressure stabilization. Both zoner shall remain shut-in usual the well-head pressure in each has stabilized, provided however, that they need not remain shut-in more
- 4. For Flow Test No. 1, one zone of the dual completion shall be produced at the normal rate of production while the other zone remains shur-in. Such test shall be continued for seven days in the case of a gas well and for 14 hours in the case of an oil well. Notes if, on an initial packer leakage text, a gas well is being flowed to the asmosphere due to the lack of a pipeline connection the flow period shall be three hours.
- 5. Following completion of Flow Text No. 1, the well shall again be shar-in, in accordance with Paragraph 3 above.
- 6. Flow Test No. 2 shall be conducted even though no leak was indicated during Flow Ten No. 1, Procedure for Flow Ten No. 2 is to be the same as for Flow Test No. 1 except

- Ir short-in is produced.
- 7. Pressures for gas-zone tests must be measured on each zone with a deadweight pressure gruge at time intervals as follow: 3 hours term: immediately prior to the beginning of each flow-period, at fifteen-minute intervals during the first hour thereof, and at hourly intervals thereafter, including one pressure measurement immediately prior to the conclusion of each flow period. 7-day term: immediately prior to the beginning of each flow period, at least one time doing each flow period (as approximately the midway point) and immediately prior to the canclusion of each flow period. Other pressure may be taken as derived, or may be requested on wells which have previously shown quesmble test data.
- 24-hour oil zone terra: all pressures, throughout the entire terr, shall be community measured and recorded with recording pressure gauges the sorurney of which must be darked at feast ewice, once at the beginning and once at the end of each test, with a desdwerght premure gauge. If a well is a guod or an od-gus dust completion, the recording gauge shall be required on the oil zone only, with deadweight pressures as required shove being taken on the gas zone.
- 8. The results of the above-described trus shall be filed in miplicate within 15 days after completion of the text. Texts shall be filed with the Aster District Office of the New Mexico Ol Conservation Division on Northwest New Mexico Packer Leakage Test Form Revised 18-01-78 with all deadweight pressures indicated thereon as well as the flowing numperatures (gas zones only) and gravity and GOR (oil sames only).
