NORTHWEST NEW MEXICO PACKER LEAKAGE TEST INSTRUCTIONS

- i. A packer leakage test shall be commenced on each multiply completed well within seven days after acrual completion of the well, and annually thereafter as possibled by the order authorizing the multiple completion. Such tests shall also be confinenced on all multiple completions within seven days following recompletion and/or eleminal or fracture treatment, and whenever remedial work has been done on a well during which the packer or the tubing rave been distratbed. Tests shall also be taken as any same that communication is suspected or when requested by the Division.
- 2. At least 72 hours prior to the commencement of any packer lealings tight, the operator shall notify the Division in writing of the exact time the test is to be commenced. Offset operators shall also be so notified.
- 3 The packer leakage test shall commence when both zones of the dualicompletion are shut-in for pressure stabilization. Both zones shall remain shut-in until the well-head pressure in each has nabilized, provided however, that they need not remain shut-in more than areas down.
- 4. For Flow Test No. 1, one zone of the dual completion shall be produced at the normal rate of production while the other zone remains shut-in. Such test shall be continued for seven days in the case of a gas well and for 24 hours in the case of an oil will. Note: if, on an initial picker leakage test, a gas well is being flowed to the atmosphere due to the lack of a pipeline connection the flow period shall be three hours.
- Following completion of Flow Test No. 1, the well shall again be abut-in, in accordance with Paragraph 3 above.
- 6 Flow Test No. 2 shall be conducted even though no leak was indicated during Flow Test No. 1 Procedure for Flow Test No. 2 is to be the same as for Flow Test No. 1 except

- that the previously produced zone shall remain shur-in while the zone which was previously shur-in is producted.
- 7. Pressures for gus-zone term must be measured on each zone with a deadweight pressure gauge at time intervals as follows: 5 hours tests: immediately prior to the beginning of each flow-period, at fafteen-manute inservals during the first hour thereof, and at hourly intervals theirsefeet, including one pressure measurement immediately prior to the conclusion of each flow period. 7-day term: immediately prior to the beginning of each flow period, at least one time during each flow period (at approximately the midmay point) and immediately prior to the conclusion of each flow period. Other pressures may be taken as desired, at may be requested on wells which have previously shown questionable test data.
- 24-hour oil zone tesu: all pressures, throughout the entire test, shall be continuously measured and receiled with recording pressure gauges the accuracy of which must be checked at least roller, once at the beginning and once at the end of each test, with a deadweight pressure gauge. If a well is a gas-oil or an ioil-gas dual completion, the recording gauge shall be ground on the oil zone only, with deadweight pressures as required above being taken on the gas zone.
- 8. The results of the above-described tests shall be filed in triplicate within 15 days after completion of the tigst. Tests shall be filed with the Aziec District Office of the New Mexico Oil Conservation Division on Northwest New Mexico Packer Leakage Test Form Revised 10-01-78 with all deadweight pressures indicated thereon as well as the flowing temperatures (gas stones only) and gravity and GOR (oil zones only).
