NORTHWEST NEW MEXICO PACKER LEAKAGE TEST INSTRUCTIONS

- A packer leakage test shall be commenced on each multiply completed well within sowen days after
 actual completion of the well, and annually thoreafter as prescribed by the order authorizing the
 multiple completion. Such tests shall also be connected on all multiple completions within sowen days
 following recompletion and/or channical or fine-test treatment, and whomever remedial work has been
 done on a well during which the packer or the tubing have been disturbed. Tests shall also be taken at
 any time that communication is suspected or when requested by the Division.
 At least 72 hours price to the commencement of any packer leakage test, the operator shall notify
- At least 72 hours prior to the communecement of any proinc leakage test, the operator shall notify the Division in writing of the exact time the test is to be communed. Offset operators shall also be so notified.
- 3. The pacies leakage test shall commence when both zones of the dual completion are shat-in for pressure stabilization. both zones shall remain shat-in until the well-head pressure in each has stabilized, provided however, that they need not remain shat-in more than seven days.
- 4. For flow Test No. 1, one some of the dual completion shall be produced at the normal rate of production while the other some remains stati-in. Such test shall be continued for sowen days if the case of a gas well and for 24 hours in the case of an oil well. Note: if, on an initial packer leakage test, a gas well is being flowed to the atmosphere due to the lack of a pipeline connection the flow period shall be these hours.
- Following completion of flow Test No. 1, the well shall again be shut-in, in accordance with Pamgraph 3 above.
- 6. Flow Test No. 2 shall be conducted even though no leak was indicated during flow Test No. 1.

 Procedure for Flow Test No. 2 is to be the same as for Flow Test No. 1

- 1. A packer leakage test shall be communated on each multiply completed well within seven days after accept that the previously produced zone shall remain shal-in while the zone which actual completion of the well, and annually thereafter as prescribed by the order authorizing the
 - 7. Pressures for gas-acros tests must be measured on each zone with a deadweight pressure gauge at time inservals as follows: 3 hours tests: immediately prior to the beginning of each flow-period, at fifteen missate inservals during the first hour thereof, and at hourly intervals thereafter, inclusting one pressure measurement immediately prior to the flow period, at least one time during each flow period (at approximately the midway point) and immediately prior to the conclusion of each flow period. Other pressures may be talant as desired, or may be requested on wells which have previously shown questionable test data.
 - 24-hour oil zone tosts: all pressures, throughout the entire test, shall be continuously measured and recorded with recording pressure gauges the accuracy of which must be checked at least twice, once at the beginning and once at the end of each test, with a deadweight pressure gauge. If a well is a pse-oil or an oil-gas dual completion, the recording gauge shall be required on the oil zone only, with deadweight pressures as required above being taken on the gas zone.

 8. The results of the above described tests shall be filed in triplicate within 15 days
 - 8. The results of the above described tests shall be filed in triplicate within 15 days after completion of the test. Tests shall be filed with the Axteo District Office of the New Mexico Oil Conservation Division of Northwest New Mexico Pacine Lealings Test form Revised 10/01/78 with all dendweight pressures indicated thereon as well as the flowing temperatures (gas zones only) and gravity and GOR (oil zones only).
