## HORTHWEST NEW MEDICO PACKER LEAKAGE TEST INSTRUCTIONS

- 1. A packer leakage terr shall be commenced on each multiply completed well within seven days after actual completion of the well, and annually thereafter as parambed by the order authorizing the multiple completion. Such term shall also be commenced on all multiple completions within seven days following recompletion and/or chemical or fracture treatment, and whenever remedial work has been done on a well during which the packer or the rubing have been disturbed. Term shall also be taken at any sine that communication is suspected or when requested by the Division.
- 2. At least 72 hours prior to the commencement of any packer leakage test, the operator shall notify the Division in writing of the exact time the test is to be commenced. Offset operators shall also be so notified.
- 3. The packer leakage test shall commence when both zones of the dual completion are shut-in for pressure stabilization. Both zones shall remain shut-in until the well-head pressure in each has stabilized, provided however, that they need not remain short-in more than seven days.
- 4. For flow Test No. 1, one zone of the dual completion shall be produced at the normal rate of production while the other zone remains shut-in. Such test shall be continued for seven days in the case of a gas well and for 24 hours in the case of an oil well. Note: if, on an initial packer leakage tert, a gas well is being flowed to the aumosphere due to the lack of a pipeline connection the flow period shall be three hours.
- 5. Following completion of Flow Text No. 1, the well shall again be shar-in, in accordance with Paragraph 3 above.
- 6. Flow Test No. 2 shall be conducted even shough no leak was indicated during flow Test No. 1. Procedure for Flow Test No. 2 is to be the same as for Flow Test No. 1 except

- that the previously produced zone shall remain shut-in while the zone which was previously short-in is produced.
- 7. Pressures for gas-zone tests must be measured on each zone with a desidweight pressure gauge at time intervals as follows: 3 hours term: immediately prior to the beginning of each flow-period, at fifteen-minute intervals during the first hour thereof, and at hourly intervals thereafter, including one pressure measurement immediately prior to the conclusion of each flow period. 7-day term: immediately prior to the beginning of each flow period, at least one time during each flow period (at approximately the midway point) and immediately prior to the continuon of each flow period. Other pressures may be caten as desired, or may be requested on wells which have previously shown quescionable con data.
- 14-hour od zone terra: all premues, throughout the entire terr, shall be con stured and recorded with recooling pressure gauges the accuracy of which must be darked at feue twice, once at the beginning and once at the end of each uses, with a desdwerghe pressure gauge. If a well is a gas-oil or an oil-gas dual completion, the recording grupe shall be required on the oil store only, with desdweight pressures as required shove being calam on the gas some.
- 8. The results of the above-described sess shall be filed in emplicate within 13 days after spiction of the test. Tests shall be filed with the Aster District Office of the New Mexico Oli Conservation Division on Northwest New Mexico Packer Leakage Test Form Revised 18-01-78 with all deadweight pressures indicated thereon as well as the flowing susperstrates (gue zones only) and gustin said GOR (oil zones only).
