## NORTHWEST NEW MEXICO PACKER LEAKAGE TEST INSTRUCTIONS

- A packer leakage test shall be commenced on each multiply completed well within seven days after
  actual completion of the well, and annually theseafter as prescribed by the order authorizing the
  multiple completion. Such tests shall also be connected on all multiple completions within seven days
  following recompletion end/or chemical or fine-ture treatment, and whenever remedial work has been
  done on a well during which the packer or the tubing have been disturbed. Tests shall also be taken at
  any time that communication is suspected or when requested by the Division.
   At least 72 hours error to the commencement of any methor believes the connector whell parties.
- At least 72 hours prior to the commencement of any packer leakage test, the operator shall notify the Division in writing of the exact time the test is to be commenced. Offset operators shall also be so notified.
- 3. The packer leakage test shall commence when both somes of the dual completion are shall not pressure stabilization. both zones shall remain shall-in until the well-head pressure in each has stabilized, provided however, that they need not remain shall-in more than seven days.
- 4. For flow Test No. 1, one zone of the dual completion shall be produced at the normal rate of production while the other zone remains shat-in. Such test shall be continued for seven days if the case of a gas well and for 24 hours in the case of an oil well. Note: if, on an initial packer leakage test, a gas well is being flowed to the atmosphere due to the lack of a pipeline commention the flow period shall be three hours.
- Following completion of flow Test No. 1, the well shall again be shat-in, in accordance with Paragraph 3 above.
- Flow Test No. 2 shall be conducted even though no leak was indicated during flow Test No. 1.
   Procedure for Flow Test No. 2 is to be the same as for Flow Test No. 1

- except that the previously produced zone shall remain shut-in while the zone which was previously shut-in is produced.
- 7. Pressures for gas-none tests must be measured on each zone with a deadweight pressure gauge at time intervals as follows: 3 hours tests: immediately prior to the beginning of each flow-period, at fifteen minute intervals during the first hour thereof, and at hourly intervals thereafter, including one pressure measurement immediately prior to the flow period, at least one time during each flow period (at appearingably the midway point) and immediately prior to the conclusion of each flow period. Other pressures may be taken as desired, or may be requested on wells which have previously shown questionable test date.
- 24-hour oil zono testa: all pressures, throughout the entire test, shall be continuously measured and recorded with recording pressure gauges the accuracy of which must be checked at least twice, once at the beginning and once at the end of each test, with a deadweight pressure gauge. If a well is a gas-oil or an oil-pas dual completion, the recording gauge shall be required on the oil zone only, with deadweight pressures as required above being talms on the gaz zone.
- 8. The results of the above described tests shall be filed in triplicate within 15 days after completion of the test. Tests shall be filed with the Azico District Office of the New Mexico Oil Conscruction Division of Northwest New Mexico Pacifier Lealings Test form Revised 10/01/78 with all deadweight pressures indicated thereon as well as the flowing temperatures (gas zones only) and gravity and GOR (oil zones only).
