NORTHWEST NEW MEXICO PACKER LEAKAGE TEST INSTRUCTIONS

- 1. A packer leakage test shall be commenced on each makinjty completed well within zeven days after actual completion of the well, and annually thereafter as prescribed by the order authorizing the multiple completions. Such tests shall also be competed on all multiple completions within seven days following recompletions unifor chemical or fine-ture treatment, and whenever remaind work has been done on a well during which the packer or the tubing have been disturbed. Tests shall also be taken at any time that communication is suspected or when nequested by the Division.
- At least 72 hours prior to the communications of any packer leakage test, the operator shall notify
 the Division in writing of the asset time the test is to be communed. Offset operators shall also be exnotified.
- 3. The packer leakage test shall commence when both zones of the dual completion are shall not pressure stabilization. both zones shall remain shall nutril the well-head pressure in each has stabilized, provided however, that they need not remain shall-in more than seven days.
- 4. For flow Test No. 1, one some of the dual completion shall be produced at the normal rate of production while the other zone someins shat-in. Such test shall be continued for seven days if the case of a gas well and for 24 hours in the case of an oil well. Note: if, on an initial pacter leakage test, a gas well is being flowed to the atmosphere due to the lack of a pipeline connection the flow period shall be three hours.
- Following completion of flow Test No. 1, the well shall again be shat-in, in accordance with Paragraph 3 shows.
- Flow Test No. 2 shall be conducted even though no lank was indicated during flow Test No. 1.
 Procedure for Flow Test No. 2 is to be the same as for Flow Test No. 1

- 1. A polar lealings test shall be commenced on each makinly completed well within seven days after

 actual completion of the well, and annually thereafter as prescribed by the order authorizing the
 - 7. Prossures for gas-mone tests must be measured on each zone with a deadweight pressure gauge at time inservals as follows: 3 hours tests: immediately prior to the beginning of each flow-period, at fifteen minute intervals during the first hour thereof, and at hourly intervals thereafter, including one pressure measurement immediately prior to the flow period, at least one time during each flow period (at approximately the midney point) and immediately prior to the conclusion of each flow period. Other pressures may be taken as desired, or may be sequested on wells which have previously shown questionable test date.

24-hour oil zone tests: all pressures, throughout the estime test, shall be continuously measured and recorded with recording pressure gauges the accuracy of which must be checked at least twice, once at the beginning and once at the end of each test, with a dendracight pressure gauge. If a woll is a gas-oil or an oil-gas dual completion, the recording gauge shall be required on the oil zone only, with deadweight pressures as required above being taken on the gaz zone.

8. The results of the above described tests shall be filed in triplicate within 15 days after completion of the test. Tests shall be filed with the Azteo District Office of the New Mexico Oil Conservation Division of Northwest New Mexico Packer Lealange Test form Revised 10/01/78 with all deadweight pressures indicated thereon as well as the flowing temperatures (gas zones only) and gravity and GOR (oil zones only).
