NORTHWEST NEW MEXICO PACKER LEAKAGE THAT INSTRUCTIONS

1. A packer leakage test shall be commenced on such multiply camplesed well within seven days after actual completion of the well, and annually shapeafted as prescribed by the order authorizing the multiple completion. Such these shall doe be commenced on all multiple completions within seven days following meanuplesion andler chemical or fracture creatment, and whenever remedial work has been done up a will during which the packer or the rubing have been disturbed. Term shall also be taken at any time that communication is respected or when requested by the Bivision.

Commenced at their, date) **

THES

LAPSED TIME

- 2. At least 72 hours prior to the commencement of any packet leakage test, the operator shall notify the Division in writing of the exact time the test is to be commenced. Offset operators shall also be so notified.
- 3. The pocker leakage test shall commence when both zones of the dual completion are shut-in for pressure stabilization. Both zones shall remain shut-in interior benefit the well-head pressure in each has stabilized, provided however, that they need not termin shut-in more than seven days.
- 4. For Flow Test No. 1, one zone of the dual completion shall be produced at the narmal rate of production while the other zone remains short-in. Such per shall be continued for seven days in the case of a gas well and for 24 hours in the case of a gas well and for 24 hours in the case of a an initial packer leakage text, a gra well is being flound to the distinguisere due to the lack of a pipeline connection the flow period shall be three hours.
- 5. Following completion of Flow Test No. 1, the well shall again be shut-in, in accordance with Paragraph 3 above.
- Flow Test'No. 2 shall be conducted even shough no lesk was indicated during Flow Test No. 1. Procedure for Flow Test No. 2 is so be the same as for Fight Test No. 1 except

- that the previously produced 2000 shall remain shut-in while the 2000 which was previously abut-in is geoduced.
- 7. Pressures for gas-some tests must be measured on each zone with a deadweight pressure gauge at time intervals as follows: 3 hours tests: immediately prior to the beginning of each film-period, at fifness-minute intervals during the first hour thereof, and at hourly intervals thereafter, including one pressure measurement immediately prior to the conclusion of each flow period. 7-day untu: immediately prior to the beginning of each

flow period, at least one time during each flow period (at approximately the midway point) and intendiately prior to the conclusion of each flow period. Other pressures may point) and infinediately prior to the canchasion of each flow period. Other pressures may be taken as disired, or may be requested on wells which have previously shown questionable test 🏝ta.

24-hour all sone tests: all pressures, throughout the entire test, shall be continuously measured and recorded with recording pressure gauges the accuracy of which must be checked at laste rwice, once at the beginning and once at the end of each test, with a deadweight papers gauge. If a well is a gus-oil or an oil-gas dual completion, the record-ing gauge shall be required on the oil zone only, with deadweight pressures as required above being when on the gas some.

8. The results of the above-described sess shall be filed in triplicate within 15 days after completion of the rest. Tesu shall be filed with the Aztec Duttier Office of the New Mexico Oil Conservation Division on Northwest New Mexico Packer Leakage Test Form Revised 10-01-78 with all deadweight pressures indicated thereon as well as the flowing temperatures (gas somes easy) and gravely and GOR (oil somes only).
