NORTHWEST NEW MEXICO PACKER LEAKAGE TEST INSTRUCTIONS

- 1. A peaker leakage test shall be commenced on each multiply completed well within seven days after actual completion of the well, sell antipolly thereafter as prescribed by the order authorizing the multiple completion. Such tests shall also be commenced on all multiple completions within seven days fellowing recompletion and/or character or fracture treatment, and whentien regardful want has been items on a well-during which the pacter or the taking home been destribed. These shall also be taken at any time that communication is appreciated or which requested by the Division.
- 2. At least 72 hours prior to the commencement of any packet lealings teel, the operator shall notify the Division in writing of the exact time the test is to be commenced. Offset operators shall also be so notified.
- 3. The pagier leatings test shall commence when both zones of the dual completion are shall be pressure stabilization. Both zones shall sample shall in until the well-head pressure in each has stabilized, provided havever, that they need not remain shall in more than seven doze.
- 4. For Plaw Test No. 1, one zone of the deal completion shall be produced at the normal rate of production while the other zone remains shall be confirmed for seven days in the case of a gas well said for 24 hours in the case of an oil well. Blate: if, on an initial packer leakage test, a gas well in being flowed to the atmosphere due to the lack of a pipaline connection the flow period shall be three hours.
- 5. Following completion of Flow Test No. 1, the well shall again be shul-in, in accordance with Paragraph 3 shove.
- 6. Flow Test No. 2 shall be conducted even though no liquk was indicated during Flow Test No. 1. Procedure for Flow Test no. 2 is to be the same as for Flow Test No. 1 except

- that the previously produced zone shall remain shall in while the zone which was previously shall in is produced.
- 7. Pressupe for gas-zone tests must be measured an each zone with a deadweight pressuregistage at time intervals as follows; 3 hours tests: immediately prior to the beginning/feach flow-period, at filese-minute intervals during the first hour thereof, and at half-ylatereds timescaler, insteading one pressure measurement immediately prior to this approximately the midway paint) and immediately prior to the conclusion of each flow period, at least one time during each flow period (at approximately the midway paint) and immediately prior to the conclusion of each flow period. Other pressures may be taken as dealered, or may be requested on wells whigh have previously shown questionable test date.
- 24-hour oil zone tests: all pressures, throughout the entire test, shall be continuously measured and recorded with recording pressure gauges the accuracy of which might be checked at least bules, cace at the beginning and once at the end of each trait, with a deadweight pressure gauge. If a well is a gas-oil or an oil-gas duel contribution, the recording gauge shall be required on the oil zone only, with deadweight pressures as required above being taken on the gas zone.
- 8. The results of the shove-described tests shall be filed in triplicate within 15 days after complicion of the test. Tests shall be filed with the Azies District Office of the NewMardin of Comercular District on northwest new Mexico packer leakage Test Form Resilied 11-16-96 with all deadweight pressures indicated thereon as writ as the flowing temperatures (gas zones only), and gravity and GCR (oil zones only).
