NORTHWEST NEW MEDICO FACKER LEAKAGE TEST INSTRUCTIONS

- 1. A parker lexisage test shall be commented on each multiply completed will within seven days after setual completion of the well, and annually thereafter as prescribed by the order authorizing the multiple completion. Such tests shall also be commented on all multiple completions within seven days following recompletion and for chemical or fracture treatment, and whenever remedial work has been done on a well during which the packet or the tubing have been disturbed. Tests shall also be taken at any time that communication is suspected or when requested by the Division.
- At least 72 hours prior to the commencement of any packer leakage test, the operator shall morely the Division or oriting of the exact tame the test is to be commenced. Offset operators shall also be so notified.
- The packer lexkage test shall commence when both zones of the dual completion are shutten for pressure stabilization. Both zones shall remain shutten until the well-head pressure in each has stabilized, provided however, that they need not remain shutten more than seven days.
- 4. For Flow Test No. 1, one zone of the dual completion shall be produced at the normal rate of production while the other zone remains shut-in. Such test shall be commend for seven days in the case of a gas well and for 24 hours in the case of an oil well. Note: if, on an initial packer leakage test, a gas well is being flowed to the aumosphere due to the lock of a priprint connection the flow period shall be three hours.
- 5. Following complexion of Flow Test No. 1, the well shall again be shur-in, in accordance with Paragraph 3 above.
- 6. Flow Test No. 2 shall be conducted even though no leak was indicated during Flow Test No. 1. Procedure for Flow Test No. 2 is so be the same as for Flow Test No. 1 except

- that the previously produced zone strall remain thus a while the zone which was previously shur-in is produced.
- 7. Pressures for gen-some even remark be measured on which a dead-weight pressure gauge at time intervals as follows: \$ hour next: instanciately prior to the beginning of each flow-period, or (directs-manuse intervals during the first hour thereof, and at hourly intervals thereafter, including one pressure measurement immediately prior to the conclusion of each flow period. 7-day term: immediately prior to the beginning of each flow period, at least one time during each flow period (at approximately the midway point) and immediately prior to the conclusion of each flow period. Other pressures may be taken as desired, or may be requested on will which have previously shown questionable test data.

 24-hour oil zone tests: all pressures, throughout the errors of which according pressured and recorded with recording pressure that according which according to the pressure of which according pressures that according which according to the pressure of which according pressures and recorded with recording pressures that a prostor of which according pressures and recorded with recording pressures that a prostor of which according to the pressure of which according to the pressure of which according pressures are pressured and recorded with pressures.
- 24-hour oil zone rest: all pressures, throughout the extrine rest, shall be continuously measured and recorded with recording pressure gauges the accuracy of which maste be checked at least twice, once at the beginning and once or the end of each test, with a deadwarent pressure gauge, if a well in a gui-oil or an oil-gas dual complexion, the recording gauge shall be required on the oil zone only, with deadweight pressure as required above being taken on the gas mosts.
- 8. The results of the above-described tests shall be filed an explicate within 13 days after completion of the test. Tests shall be filed with the Aztre District Office of the New Mexico Oil Conservation Division on Northwest New Mexico Packer Leakage Test form Revised 10-01-78 with all deadweighte pressures indicated therefore as well as the flowing temperatures (gas zones only) and gravity and GOR (oil zones only).
