## WEST NEW MEXICO PACKER LEAKAGE TEST INSTRUCTIONS

- 1. A packer leakage test shall be commenced on each multiply completed well within seven days after actual completion of the well, and assually thereafter as prescribed by the order authorizing the multiple completion. Such tests shall also be commenced on all multiple completions within seven days following recompletion and/or chamical or flucture treatment, and whenever remedial work has been done on a well during which the packer or the tables have been disturbed. Tests shall also be taken at any time that communication is assepted or when requested by the Philaine.
- At least 72 hours prior to the commencement of any packer leakage test, the operator shall notify the Division in writing of the exact time the test is to be commenced. Offset operators shall also be so notified.
- The packer leakage test shall commence when both zones of the dual completion are shul-in for presence stabilization. Both zones shall remain shul-in until the well-head pressure in each less stabilized, provided isossever, that they need not remain shul-in more than seven days.
- 4. For Plow Test No. 1, one zone of the deal completion shall be produced at the normal rate of production while the other zone remains shal-in. Such test shall be continued for seven days in the case of a gas well and for 24 hours in the case of an oil well. Note: if, on an initial packer leakage test, a gas well is being flowed to the atmosphere due to the lack of a pipeline connection the flow period shall be three hours.
- Following completion of Flow Test No. 1, the wall shall again be shut-in, in accordance with Paragraph 3 above.
- 6. Flow Test No. 2 shall be conducted even though no leak was indicated during Flow Test No. 1. Procedure for Flow Test no. 2 is to be the same as for Flow Test

- that the previously produced zone shall remain shat-in while the zone which v previously shat-in is produced.
- 7. Pressures for gas-zone tests must be measured on each zone with a deadweight pressure gauge at time intervals as follows: 3 hours tests: immediately prior to the beginning of each flow period, at filese-minute intervals during the first hours thereof, and at hourly intervals thereafter, including one pressure measurement immediately prior to the beginning of each flow period, at least one time during each flow period (at approximately the micheay point) and immediately prior to the conclusion of each flow period. Other pressures may be taken as dealerd, or may be requested on wells which have previously shown questionable test date.
- 24-hour oil zone tests: all pressures, throughout the entire lest, shall be confinancely measured and recorded with recording pressure gauges the accuracy of which must be checked at least twice, case at the beginning and once at the end of each test, with a deadweight pressure gauge. If a well is a gas-oil or an oil-gas dual complation, the recording gauge shall be required on the oil zone only, with deadweight pressures as required above being taken on the gas zone.
- 8. The result a of the above-described tests shall be filed in triplicate within 15 days after completion of the test. Tests shall be filed with the Astes District Office of the New Mindoo of Conservation Division on northwest new Mindoo packer testings Test Form Revised 11-16-96 with all deadweight pressures indicated thereon as writ as the flowing temperatures (gas zones only) and gravity and GOR (oil zones only).
