## NORTHWEST NEW MEXICO PACKER LEAKAGE TEST INSTRUCTIONS

- A pacter testage test shall be commenced on each multiply completed well within seven days after -viction. Such tests small also be connected on all multiple completions within seven days following monistive analor character fracture treatment, and whonever remodial work has been done on a well pressure gauge at time intervals as follows: 3 hours tests: immediately prior to the during which the packer or the taking have been disturbed. Tests shall also be taken at any time that communication is suspected or when sequented by the Division.
- 2. At least 7 wars prior to the commencement of any packer leakage test, the operator shall notify the Division in were my of the exact time the test is to be commenced. Offset operators shall also be so notified.
- 3. The packer scalings test shall commence when both zones of the dual completion are shut-in for pressure stabilization, both zones shall somein shut-in until the west-read pressure in each has stabilized, provided however, that they need not remain shut-in more than seven cays.
- 4. For flow Test No. 1, one none of the dual completion shall be produced at the normal rate of production while the other none remains shut-in. Such test shall be continued for seven days if the one of a gas well and for 24 hours in the case of an oil well. Note: if, on an initial packer leakage test, a gas well is being flowed to are star-subare due to the lack of a pipeline correction the flow period shall be three hours.
- 5. Following completion or slow start No. 1, the well shall again be shat-in, in accordance with Рагадлара 3 авоче.
- 6. Flow Test No. 2 shall be constacted even though no leak was indicated during flow Test No. 1. Procedure for Flow Test No. 2 is to be the same as for Flow Test No. 1

- except that the previously produced zone shall remain shut-in while the zone which
- was previously shu-us is produced.
  7. Pressures for gus-zons tests must be measured on each zone with a deadweight beginning of each flow-period, at fifteen minute intervals during the first hour thereof, and at hourly intervals thereafter, including one pressure measurement immediately prior to the flow period, at least one time during each flow perios (at proximately the midway point) and immediately prior to the conclusion of each flow period. Other pressures may be taken as desired, or may be requested on wells which have proviously shown questionable test data.
- 24-hour oil zone tests: all pressures, throughout the entire test, shall be musty measured and recorded with recording pressure cauges the accuracy of which must be checked at least twice, ones at the beginning and once at the end of each test, with a deadweight pressure gauge. If a well is a gas-oil or an oil-gas dual completion, the recording gauge shall be required on the oil zone only, with deadweight pressures as required above being taken on the gaz zone.
- 8. The sessats of the above described tests shall be filed in triplicate within 15 days after completion of the test. Tests shall be filed with the Aztec District Office of the Test form Revised 10/01/78 with all deadweight pressures melicates there as the flowing temperatures (gas zones only) and gravity and  $-\Omega R$  (oil  $z_{\rm fit}$
