NORTHWEST NEW MEXICO PACKER LEAKAGE TEST INSTRUCTIONS

- NORTHWEST NEW MEXICO PACKER LEAKAGE TEST INSTRUCTIONS

 A packer leakage test shall be commenced on each multiply completed well within seven days after acual completion of the well, and annually thereafter as prescribed by the order authorizing the multiple completion. Such tests shall also be connected on all multiple completions within seven days following recompletion and/or chemical or fracture treatment, and whenever remedial work has been done on a well during which the packer or the tubing have been disturbed. Tests shall also be taken at any time that communication is suspected or when requested by the Division.

 A pressures for gas-zone tests must be measured on each zone with a deadweight pressure gauge at time intervals as follows: 3 hours tests: immediately prior to the degimning of each flow-period, at filtered minate intervals thereafter, including one pressure measurement.

 A pressures for gas-zone tests must be measured on each zone with a deadweight pressure gauge at time intervals as follows: 3 hours tests: immediately prior to the degimning of each flow period, at filtered minate intervals must be remained as follows: 3 hours tests: immediately prior to the degimning of each flow period, at fleast one time during each flow period (at approximately the mixtury point) and immediately prior to the conclusion of each flow period (at approximately the mixtury point) and immediately prior to the conclusion of each flow period (at approximately the mixtury point) and immediately prior to the conclusion of each flow period (at the Division in writing of the exact time the test is to be commenced. Offset operators shall also be so
- notified.
- notunes.

 3. The packer leakage test shall commence when both zones of the dual completion are shas-in pressure stabilization, both zones shall remain shas-in until the well-head pressure in each has
- pressure subditization. both zones shall remain shall-in until the well-head pressure in each has stabilized, provided however, that they need not remain shall-in more than seven days.

 4. For flow Test No. 1, one zone of the dual completion shall be produced at the normal rate of production while the other zone remains shall-in. Such test shall be continued for seven days if the case of a gas well and for 24 hours in the case of an oil well. Note: if, on an initial packer leakinge test, a gas well is being flowed to the atmosphere due to the lack of a pipeline connection the flow period shall be these.
- be three hours.

 5. Following completion of flow Test No. 1, the well shall again be shut-in, in accorda
- 6. Flow Test No. 2 shall be conducted even though no leak was indicated during flow Test No. 1. Procedure for Flow Test No. 2 is to be the same as for Flow Test No. 1

- beginning of each flow-period, at iffece mirrate intervals thring the first hour thereof, and at hourly intervals thereafter, including one pressure measurement immediately prior to the flow period, at least one time during each flow period (at approximately the midway point) and immediately prior to the conclusion of each flow period. Other pressures may be taken as desired, or may be requested on wells which have previously shown questionable test data.

 24-hour oil zone tests: all pressures, throughout the entire test, shall be
- continuously measured and recorded with recording pressure gauges the socuracy which must be checked at least twice, once at the beginning and once at the end of cach test, with a deadweight pressure gauge. If a well is a gas-oil or an oil-gas dual completion, the recording gauge shall be required on the oil zone only, with deadweight pressures as required above being taken on the gaz zone.
- 8. The results of the above described tests shall be filed in triplicate within 15 days after completion of the test. Tests shall be filed with the Azice District Office the New Mexico Oil Conservation Division of Northwest New Mexico Packer Leakage Test form Revised 10/01/78 with all deadweight pressures indicated o District Office of thereon as well as the flowing temperatures (gas zones only) and gravity and GOR (oil zones only).
