NORTHWEST NEWMEXICO PACKER LEAKAGE TEST INSTRUCTIONS

- I. A packet leakage tes, shall be commenced on each multiply completed well within seven days after actual completion of the well, and annually interesting a prescribed by the order authorizing the multiple completion. Such tests shall also be commenced on all multiple completions within seven days to accompletion and or chemical or fracture treatment, and whenever remedial wors has been done on a well during which the packer or the tubing have been disturbed. Tests shall also be taken at any time that communication is suspected or when requested by the Division.
- 2. At least 72 hours prior to the commencement of any packer leakage test, the operator shall notify the Division in writing of the exact time the test is to be commenced. Offse, contators shall use he so notified.
- 3. The packer leakage test shall commence when both zeroes of the dual completion are statistic for pressure starification. Both zones shall remain shut-in until the well-head pressure or each has stabilized previously dual new even that they need not remain shut-in more fairnesser days.
- 4. For Flow Fest No. 1, one zone of the dual complete it shall be produced at the normal tate of production while the other zone remains state in. Such test shall be cominated for severel days in the case of a gas well and for 24 hours. The case of an off-well. Note, if on a limit all packet leavage test a gas well is nong flowed to the atmosphere due to fack of a papering connection the flow period shall be three notes.
- S . Tolk wing completion of blow lost $N_{\rm co}$, the well small again be shut-in in accordance with Paragrap (3 above).
- Flow Test No.2 sual perconducted continuous in cus was inflicated during Func-Lest No. 1. Proceeding the Faw Test No. 2 six Notice samplus for Flow Test No. 3 except

- that the previously produced zone shall remain shut-in while the zone which was previously shut-in is produced
- 7. Pressures for gas-zone tests must be measured on each zone with a deadweight pressure gauge at time intervals as follows. 3 hours tests immediately prior to the beginning of each flow period, at fifteen-minute intervals during the first hour thereof, and at hourly intervals thereafter, including one pressure measurement immediately prior to the conclusion of each flow period. 7-day tests immediately prior to the beginning of each flow period, at least one time during each flow period (at approximately the midway point) and immediately prior to the conclusion of each flow period. Other pressures may be taken as desired, or may be requested on wells which have previously shown questionable test data.

 24-hour oil zone tests, all pressures, throughout the entire test, shall be continuously
- 24-hour oil zone tests, all pressures, throughout the entire test, shall be continuous measured and recorded with recording pressure gauges the accuracy of which must be checked at feast twice, once at the beginning and once at the end of each test, with a deadweight pressure gauge. If a well is a gas-oil or an oil-gas dual completion, the recording gauge shall be required on the oil zone only, with deadweight pressures as required above being taken on the gas zone.
- 8. The results of the above-cescribed tests shall be filed in triplicate within 15 days after completion of the test. Tests shall be filed with the Aztec District Office of the New Mexico Oil Conservation Division on Northwest. New Mexico Packer Leakage Test Form Revised 75-01-78 with all deadweight pressures indicated thereon as well as the flowing temperatures (gas zones only) and gravity and GOR (oil zones only).
