NORTHWEST NEW MEXICO PACKER LEAKAGE TEST INSTRUCTIONS

- 1. A packer leakage test shall be commenced on each multiply commended well within seven days after actual completion of the well, and annually thereafter as prescribed by the order authorizing the multiple completion. Such tests shall also be connected on all multiple completions within seven days following recompletion and/or chemical or frac-ture treatment, and whenever remedial work has been pressure gauge at time intervals as follows: 3 hours tests: immediately prior to the following recompletion and/or chemical or fracture treatment, and whenever remedial work has been done on a well during which the packer or the tubing have been disturbed. Tests shall also be taken at any time that communication is suspected or when requested by the Division.

 2. At least 72 hours prior to the communication of any packer leakage test, the operator shall notify the Division in writing of the exact time the test is to be commenced. Offset operators shall also be so
- notified.

 The nuclear leakage test shall commence when both zones of the cuas commercion are sout-in for
- pressure stabilization, both zones shall remain shut-in until the weit-head pressure in each has stabilized, provided however, that they need not remain shut-in more tism seven days.

 4. For flow Test No. 1, one zone of the dual completion shall be produced at the normal rate of production while the other zone remains shut-in. Such test shall be continued for seven days if the case of a gas well and for 24 hours in the case of an oil well. Note: if, on an initial packer leakage test, a gas well is being flowed to the atmosphere due to the lack of a pipeline connection the flow period shall
- Following completion of flow Test No. 1, the well shall again be sinst-in, in accordance with Paragraph 3 above.
- rangings 3 score.

 6. Flow Test No. 2 shall be conducted even though no leak was indicated during flow Test No. 1.

 Procedure for Flow Test No. 2 is to be the same as for Flow Test No. 1

- pressure gauge at time intervals as follows: 3 hours tests: immediately prior to the beginning of each flow-period, at fifteen minute intervals during the first hour organized to each sove-period, at inseen minute inservais during one has nour thereof, and at hourly intervals thereafter, including one pressure measurement immediately prior to the flow period, at least one time during each flow period (at approximately the anidway point) and immediately prior to the conclusion of each flow period. Other pressures may be taken as desired, or may be requested on wells
- now person. Other pressures may be taken as accuract, or may be requested on wells which have previously shown questionable test data.

 24-hour oil zone tests all pressures, throughout the entire test, shall be continuously measured and recorded with recording pressure gauges the accuracy of which must be cheeked at least twice, once at the beginning and once at the end of each test, with a deadweight pressure gauge. If a well is a gas-oil or an oil-gas dual completion, the recording gauge shall be required on the oil zone only, with deadweight pressures as required above being taken on the gaz zone.

 8. The results of the above described tests shall be filed in triplicate within 15 days
- a. The results of the above described tests shall be filled with the Azteo District Office of the New Mexico Ofil Conservation Division of Northwest New Mexico Packer Leakage Test form Revised 10/01/78 with all deadweight pressures indicated thereon as well as the flowing temperatures (gas zones only) and gravity and GOR (oil zonce only).
