## NORTHWEST NEW MEDICO PACKER LEAKAGE TEST INSTRUCTIONS

Date

A packer leakage tert shall be commenced on each multiply completed will within an days after actual completion of the well, and annually theirafter as persunited by the er authorizing the authorizing completion. Such tests shall also be commenced on all tuple completions within seven days following recompletion and/or chemical or fractive terminations within seven days following recompletion and/or chemical or fractive treatment, and whenever remedial work has been done on a well during which the test or the tubing have been districted. Tests shall also be taken at any time that commission is suspected or when requested by the Division.

Deputy Oil & Gas Inspector

At least 72 hours point to the commencement of any packer leakage test, the operator if notify the Division in writing of the exact time the test is to be commenced. Offset rators shall also be so notified.

The packer leakage test shall commence when both zones of the dual compliction are trun for previous stabilization. Both zones shall remain shut-in until-the dell-head users in each has stabilized, provided however, that they need not remain shut-in more a seven days.

For Flow Test No. 1, one zone of the dual completion shall be produced at the normal of production while the other zone remains shut-in. Such that shall be considered for in days in the case of a gas well and for 24 hours in the case of an oil well. Neget if, on nitial packer leakage test, a gas well is being flowed to the atmosphere due to the lack pipeline connection the flow period shall be three hours.

Following completion of Flow Test No. 1, the well shall again be shut-in, in accor-

Flow Test'No. 2 shall be conducted even though no leak was indicated dusing Flow t No. 1. Procedure for Flow Test No. 2 is so be the same as far Flow Test No. 4 except

that the previously produced zone shall remain abut-in while the zone which was previously shut-in is produced.

7. Pressures for gas-same tests must be measured on each zone with a deadweight pressure gauge at time intervals as follows: 3 hours tests: immediately prior to the beginning of each flow-period, at fafteen-minute intervals during the first hour thereof, and at hourly intervals therexfug, including one pressure measurement immediately prior to the conclusion of each flow period. 7-day tests: immediately prior to the beginning of each flow period, at least out time during each flow period (at approximately the midway point) and immediately prior to the conclusion of each flow period. Other pressures may be taken as desired, or may be requested on wells which have previously shown questionable test data.

24-hour oil zone tenti; all pressures, throughout the entire test, shall be continuously measured and recorded with recording pressure gauges the accuracy of which must be checked at least twice, once at the beginning and once at the end of each test, with a dendweight pressure gauge. If a well is a gas-oil or an oil-gas dual completion, the recording gauge shall be requisted on the oil zone only, with deadweight pressures as required above being taken on the gas zone.

8. The results of the slighte-described tests shall be filed in triplicate within 15 days after completion of the test. Tiths shall be filed with the Azree District Office of the New Mexico Oil Conservation Divising on Northwest New Mexico Packet Leakage Test Form Revised 10-01-78 with all deadlought pressures indicated thereon as well as the flowing temperatures (gas somes girly) and gravity and GOR (oil 2000s only).
