NORTHWEST NEWMEXICO PACKER LEAKAGE TEST INSTRUCTIONS

- $1-\Delta$ packer leakage test shall be commenced on each multiply completed well within seven days after actual completion of the w(b) and annually thereafter as prescribed by the order authorizing the multiple completion. Such tests shall also be commenced on all multiple completions within seven days following recompletion and or chemical or fracture treatment, and whenever remedial work has been done on a well during which the packer or the tubing have been disturbed. Tests shall also be taken at any time that communication is suspected or when requested by the Division
- 2. At least 72 hours prior to the commer cement of any packer leakage test, the operator shall notify the Division in writing of the evact time the test is to be commenced. Offset operators shall also be so notified.
- 3 The packer leakage test shall commerce when both zones of the dual completion are shut-in for pressure stabilization. Both zones shall remain shut-in until the well-head pressure in each has stabilized, provided he wever, that they need not remain shut-in more than seven days.
- 4. For Flow Test No. 1, one zone of the dual completion shall be produced at the normal rate of production while the other zone renams shuts in. Such test shall be continued for seven days in the case of a gas well and for 24 hours in the case of an oil well. Note if, on an initial packer leakage test, a gas well is being those of the atmosphere due to lack of a pipeline connection the flow period shall be three hours.
- 5 . Following completion of Flow Test No. 1, the well shall again be shut-in, in accordance with Paragraph 3 above
- 6 Flow Test No. 2 shall be conducted even though no leak was indicated during Flow Test No. 1. Procedure for Flow Test No. 3 is to be the same as for Flow Test No. 1 except

- that the previously produced zone shall emain shut-in while the zone which was previously shut-in is produced
- 7. Pressures for gas-zone tests must be measured on each zone with a deadweight pressure gauge at time intervals as follows. 3 hours tests immediately prior to the beginning of each flow period, at fifteen-minute intervals during the first hour thereof, and at hours intervals thereafter, including one pressure measurement immediately prior to the conclusion of each flow period. 7-day tests immediately prior to the beginning of each flow period, at least one time curing each flow period of approximately the midway point) and immediately prior to the conclusion of each flow period. Other pressures may be taken as desired or may be required.
- may be requested on wells which have greviously shown questionable test data. 24-hour oil zone tests all pressures throughout the entire test, shall be continuously measured and recorded with recording pressure gauges the accuracy of which must be checked at least twice, once as the beginning and once at the end of each test, with a deadweight pressure gauge. If a well is a gas-oil or an oil-gas dual completion, the recording gauge shall be required on the jud zone only with deadweight pressures as required above being taken on the gas 2-10c.
- 8. The results of the above-described lests shall be filed in triplicate within 15 days after completion of the test. Tests shall be filed with the Artec District Office of the New Mexico Oii Conservation Division on Northwes. New Mexico Packer Leakage Test Form Revised 10-01-78 with all deadweight pressures indicated thereon as well as the flowing temperatures (gas zones only) and gravin, and GOR (oii zones only).
