6175 feet ground level

DETAILS OF WORK

(State names of and expected depths to objective sands; show sizes, weights, and lengths of proposed casings; indicate mudding jobs, cementing points, and all other important proposed work)

Reynolds proposes to drill this well to 5200 feet total depth. Approximately 300 feet of 16 1/4-inch, 32.75 pound, 8-40 casing will be run with a sufficient amount of cement to completely cement the casing from bottom to top. All prospective oil and gas zones will be adequately tested by casing and/or drill stem testing. Mud will be used from the surface of the ground to total depth in order to insure good samples. The objective sand is expected at the approximate depth of 1800 feet. If oil and gas are found to be in commercial quantities, 5 1/2-inch casing will be run and cemented with sufficient cement to protect all commercial oil and gas zones.

I understand that this plan of work must receive approval in writing by the Geological Survey before operations may be commenced.
