NORTHWEST NEW MEXICO PACKER LEAKAGE TEST INSTRUCTIONS

- 1. A pacter lookage test shall be commenced on each multiply completed well within seven days after except that the previously produced zone shall remain shall-in while the zone which actual completion of the well, and arounily thereafter as prescribed by the order authorizing the multiple completion. Such tests shall also be commented on all multiple completions within seven days
 following recompletions and/or chamical or fracture treatment, and whenever recordial work has been
 presente gauge at time intervals as follows: 3 hours tests: immediately prior to the done on a well during which the pacine or the tubing have been disturbed. Tools shall also be taken at any time that communication is suspected or when requested by the Division.
- 2. At least 72 hours prior to the communications of any paoler leakage test, the operator shall notify the Division in writing of the stant time the test is to be communicated. Offset operators shall also be so notified.
- 3. The protest inches test shall communes when both somes of the dual completion are shall in for pressure stabilization. both some shall promin shut-on until the well-bond pressure in each less stabilized, provided however, that they need not romain shut-in more than seven days.
- 4. For flow Test No. 1, one some of the dual completion shall be produced at the moment rate of production while the other zone parasins shut-in. Such test shall be continued for seven days if the case of a gas well and for 24 hours in the case of an oil well. Note: if, on an initial packer leakage test, a gas well is being flowed to the atmosphere due to the lack of a pipeline commertion the flow period shall he there hours.
- 5. Following completion of flow Test No. 1, the well shall again be shalling in accordance with Paragraph 3 abovs.
- 6. Flow Test No. 2 shall be conducted even though no leak was indicated during flow Test No. 1. Procedure for Flow Test No. 2 is to be the same as for Flow Test No. 1

- was proviously shut-in is produced.
- beginning of each flow-ported, at fifteen minute intervals during the first hour thoses, and at hourly intervals thoses, for, including one pressure measurement immediately prior to the flow period, at least one time during each flow period (at approximately the midway point) and immediately prior to the conclusion of each flow period. Other pressures may be taken as desired, or may be requested on wells which have previously shows questionable test date.
- 24-hour oil zons tosts: all pressures, throughout the exists test, shall be ounly measured and recorded with recording pressure gauges the accusery of which must be obscired at least twice, once at the beginning and once at the end of cach test, with a deadweight pressure gauge. If a well is a gas-oil or an oil-gas duni completion, the recording gauge shall be required on the oil zone only, with deadweight pressures so required above being taken on the par zone.
- 8. The sesuits of the above described tests shall be filed in triplicate within 15 days after completion of the test. Tests shall be filed with the Astee District Office of the New Mexico Oil Conservation Division of Northwest New Mexico Packer Leakage Test form Revised 10/01/78 with all deadweight pressures indicated thereon as well as the flowing temperatures (gas some only) and gravity and GOR (oil somes only).
