NORTHWEST NEW MEXICO PACKER LEAKAGE TEST INSTRUCTIONS

- 1. A packer leakage test shall be commenced on each multiply completed well within seven days after except that the provincely produced sons shall remain about in while the sons which actual completion of the well, and assembly thereafter as prescribed by the order authorizing the pie completion. Such men shall also be connected on all multiple completions within seven days ring recompletion and/or chamical or fracture treatment, and whomever remedial work has been done on a well during which the packer or the tubing have been disturbed. Tests shall also be taken at unication is suspected or whom requested by the Division.
- 2. At least 72 hours prior to the comm ment of any paciest insings test, the operator shall attify the Division in writing of the exact time the text is to be communed. Offset operators shall also be so
- 3. The packer leakage test shall con more when both some of the dust completion are shut-in for proseurs subilization, both zones shall remain shee in until the well-head pressure in each less subilized, provided however, that they need not remain shee in more than seven days.

 4. For flow Test No. 1, one zone of the dual completion shall be produced at the normal rate of
- production while the other zone remains shap in. Such test shall be continued for seven days if the case of a gas well and for 24 hours in the case of an oil well. Note: if, on an initial packer leakage test, a gas well is being flowed to the atmosphere due to the lack of a pipeline connection the flow period shall he those hours.
- 5. Following completion of flow Test No. 1, the well shall again be shut-in, in accordance with Paragraph 3 above.
- 6. Flow Test No. 2 shall be conducted even though no leak was indicated during flow Test No. 1. Procedure for Flow Test No. 2 is to be the same as for Flow Test No. 1

and the second of the second o

- s proviously shut in is produced.
- ne for pas-some tests must be measured on each some with a deadweight 7. Pres name gauge at time impresis as follows: 3 hours tests: immediately prior to the egissing of each flow-period, at fifteen minus intervels during the first hour reof, and at hourly intervals thereafter, including one pressure measure diesely prior to the flow period, at least one time during each flow period (at unity the uniterry point) and immediately prior to the conclusion of each parind. Other pressures may be taken as desired, or may be requested on wells high have proviously shown questionable test data.
- per oil mean team; all pressures, throughout the entire test, shall be patimently measured and recorded with recording pressure gauges the accuracy of high must be checked at least twice, once at the beginning and once at the end of ach tast, with a deadweight prossure gauge. If a well is a gas-oil or an oil-gas dual tion, the recording gauge shall be required on the oil some only, with veight pressures as required above being taken on the gaz some
- 5. The results of the above described tests shall be filed in triplicate within 15 days after completion of the test. Tests shall be filed with the Azec District Office of the New Mexico Oil Comervation Division of Northwest New Mexico Packer Leakage Test form Revised 10/01/78 with all deadweight pressures indicated thereon as well as the flowing semperatures (gas zones only) and gravity and GOR (oil zones only).
