The elevation of the derrick floor above sea level is **5873** ft. **Ground level, ungraded.**

DETAILS OF WORK

(State names of and expected depths to objective sands; show sizes, weights, and lengths of proposed casings; indicate mudding jobs, cementing points, and all other important proposed work)

After flowing the lead, the well was shut in for 24 hours. Then it was allowed to flow through various experimental chokes. It was finally given a potential test and flowed at the rate of 141 barrels of oil per day, plus 430,000 cubic feet of gas per day through a 48/64" choke. This potential is based on 88.33 barrels of oil in 15 hours and 15 minutes, with a tubing pressure of 1400 and casing pressure of 680+. The GCR is 3192:1. The well is completed and is now shut in, awaiting construction of permanent tank batteries.

I understand that this plan of work must receive approval in writing by the Geological Survey before construction may be commenced.
