NORTHWEST NEW MEXICO PACKER LEAKAGE TEST INSTRUCTIONS

- 1. A packer leakage test shall be commenced on each multiply completed well within seven days after except that the previously produced zone shall remain shall-in while the zone which actual compission of the well, and annually thereafter as prescribed by the order authorizing the multiple completion. Such tosts shall also be connected on all multiple completions within seven days 7. Processes for gas-sone tests must be measured on each zone with a deader following recomplation and/or chemical or fracture treatment, and whenever remedial work has been pressure gauge at time intervals as follows: 3 hours tests: immediately prior to the done on a well during which the pacine or the taking have been disturbed. Tests shall also be taken as beginning of each flow-period, at fifteen minute intervals during the first hour any time that communication is suspected or when requested by the Division.
- 2. At least 72 hours prior to the commencement of any pactor leakage tost, the operator shall notify the Division in writing of the exact time the test is to be commenced. Offset operators shall also be so potified.
- The product leadings test shall commence whom both somes of the dual completion are shall for pressure stabilization. both some shall remain shall in until the well-hand pressure in each last stabilized, provided however, that they med not somein shut-in more than seven days.
- 4. For flow Test No. 1, one zone of the dual completion shall be produced at the normal sate of production while the other none remains shut-in. Such test shall be continued for seven strys if the case of a gas well and for 24 hours in the case of an oil well. Note: if, on an initial packer lealings test, a gas well is being flowed to the atmosphere due to the lack of a pipeline connection the flow period shall be three hours.
- 5. Following completion of flow Test No. 1, the well shall again be shat-in, in accordance with Paragrapis 3 abovo.
- 6. Flow Test No. 2 shall be conducted even though no leak was indicated during flow Test No. 1. Procedure for Flow Test No. 2 is to be the same as for Flow Test No. 1

A CONTRACTOR OF THE CONTRACTOR

- was proviously shut-in is produced.
- thoseof, and at hourly intervals theseafter, including one pressure measurem immediately prior to the flow period, at least one time during each flow period (at approximately the midwey point) and immediately prior to the conclusion of each flow period. Other pressures may be taken as desired, or may be requested on wells which have proviously shown questionable test data.
- 24-hour oil zons tosts: all pressures, throughout the entire test, shall be continuously measured and recorded with recording pressure gauges the accu which must be checked at least twice, once at the beginning and once at the end of each test, with a deadweight pressure gauge. If a well is a gas-oil or an oil-gas dual completion, the recording gauge shall be required on the oil zone only, with dendweight pressures as sequired above being tales on the gez zone.
- 8. The sesuits of the above described tests shall be filled in triplicate within 15 days after completion of the test. Tests shall be filed with the Atten District Office of the New Mexico Oil Conservation Division of Northwest New Mexico Packer Lealings Test form Revised 10/01/78 with all deadweight pressures indicated thereon as well as the flowing temperatures (gas some only) and gravity and GOR (oil some only).
