

DEVELOPMENT PLAN FOR SURFACE USE

FOR Bedford, Inc. #1 RAM well
NW/4 NW/4 S8, T26N, R12W
San Juan Co. New Mexico

The attached USGS 1:24,000 scale topographic map indicates the proposed location, the existing roads and the location of existing wells in the immediate area. The proposed location is accessible by an existing main road running north from El Paso Natural Gas Company's Chaco Plant and by a secondary road extending from this road to the operator's #1 Nelson producing well (Gallup Fm. producer) which is also in the northeast quarter of section 8. The location is immediately beside the latter road and no additional access roads are required.

The water supply to drill the well will be supplied by trucking either from El Paso's Chaco Plant or from the San Juan River.

All trash and garbage introduced by the drilling of this well will be collected, placed in the reserve mud pit (to be dug) and buried upon completion of the drilling.

The location layout for drilling is indicated on the attached drawing. No airstrips are contemplated.

Upon completion of drilling, all pits will be filled, the location cleaned and leveled to as close to the original contour as is possible.

The field representative for the drilling of this well is Mr. Larry A. Bedford, Box E, Farmington, N.M. (Ph 505-325-1211) who should be contacted if further environmental requirements need be discussed.
