NORTHWEST NEW MEXICO PACKER LEAKAGE TEST INSTRUCTIONS

Date

 A packer leakage cest shall be commenced on each multiply completed well within seven days after acreal completion of the well, and annually thereafter as prescribed by the order authorizing the multiple completion. Such resu shall also be commenced on all multiple completions within seven days following recompletion and/or chemical or fracture treatment, and whenever remedial work has been done on a well during which the packer or the rubing have been disturbed. Tests shall also be taken at any time that consmunication is suspected or when requested by the Division.

DEPUTY OIL & GAS INSPECTOR, DIST. #3

Title

- At least 72 hours prior to the commencement of any packer leakage test, the operator shall notify the Division in writing of the exact time the test is to be commenced. Offset operators shall also be so notified.
- The packer leakage test shall commence when both zones of the dual completion are shur-in for previous stabilization. Both zones shall remain shur-in until the well-head pressure in each has stabilized, provided however, that they need not remain shur-in more than seven days.
- 4. For Free Tex No. 1, one zone of the dual completion shall be produced at the normal rate of production while the other zone remains short-in. Such text shall be continued for seven days in the case of a gas well and for 24 hours in the case of an oil well. Note: if, on an initial packer leakage text, a gas well is being flowed to the aemosphere due to the lack of a pipeline connection the flow period shall be three hours.
- Following completion of Flow Test No. 1, the well shall again be short-in, in accordance with Paragraph 3 above.
- Flow Test'No. 2 shall be conducted even though no leak was indicated during Flow.
 Fracedure for flow Test No. 2 is to be the same as for Flow Test No. 1 encept

- that the previously produced zone shall remain abus-in while the zone which was previously shot-in is produced.
- 7. Pressures for gas-zone tests must be measured on each zone with a deadweight pressure gauge at time intervals as follows: 3 hours tests: immediately prior to the beginning of each flow-period, as fifteen-minuse intervals during the first hour thereof, and at hourly intervals thereafter, including one pressure measurement interediately prior to the conclusion of each flow period. 7-day tests: immediately prior to the beginning of each flow period, at least one time during each flow period (at approximately the midway point) and immediately prior to the conclusion of each flow period. Other pressures may be taken as desired, of may be requested on wells which have previously shown questionable test data.

24-hour oil some texts: all pressures, throughout the entire text, shall be continuously measured and recorded with recording pressure gauges the accuracy of which must be checked at least rwire, once at the beginning and once at the end of each text, with a deadweight pressure gauge. If a well is a gas-oil or an oil-gas dual completion, the recording gauge shall be required on the oil zone only; with deadweight pressures as required above being taken on the gas zone.

8. The results of the above-described term shall be filed in triplicate within 15 days after completion of the term. Term shall be filed with the Astec Durant Office of the New Mexico Oil Conservation Division on Northwest New Mexico Packer Leakage Tern Form Revised 10-01-78 with all deadweight premares indicated thereon as well as the flowing temperatures (gas zones only) and gravity and GOR (oil zones only).
