If well is directionally drilled, give subsurface locations and measured and true vertical depths for all markers and zones pertinent to this work.)\*

Pro New Mexico has installed a progressive cavity pump in an attempt to dewater this well. When the well was first tested in March 1993, it produced an average of 235 barrels of water per day for one week. At this time, we plan to test the well for approximately 90 days. It is estimated that initially the well will produce 250 barrels of water per day, with no gas being produced. Three Rivers Trucking will haul and Basin Disposal will dispose the produced water.

We request permission to vent initial gas production, in an amount not exceeding 30 Mcf/d. Production in excess of that volume will be used to operate the pumping unit. Once the production level reach 50 Mcf/d, we intend to proceed immediately with pipeline connection. Our proposal for installation of line pipe to connect to an existing El Paso Natural Gas pipeline was approved by your office in February 1993.
