NORTHWEST NEW MEDICO PACKER LEAKAGE TEST INSTRUCTIONS

- 1. A packer leakage test shall be commenceed on each multiply completed well within seven days after actual completion of the well, and annually thereafter as prescribed by the order authorizing the multiple completion. Such term shall also be commenced on all multiple completions within seven days following secompletion and/or chemical or fracture treatment, and whenever temedial work has been done on a well during which the packer or the rubing have been durabed. Tests shall also be taken at any time that communication is suspected or when requested by the Division.
- 2. At least 72 hours prior to the commencement of any packer leakage test, the operator shall minify the Division in writing of the exact tunic the test is to be commented. Offset operators shall also be so notified.
- 3. The packer leakage test shall commence when both zones of the dual completion are shut-in for pressure rabilization. Both zones shall remain shut-in until the well-head pressure in each has stabilized, provided however, that they need not remain shut-in more than seven days.
- 4. For Flow Ten No. 1, one zone of the dual completion shall be produced at the normal rate of production while the other zone remains shut-in. Such ten shall be continued for seven days in the case of a gas well and for 14 hours in the case of an oil well. Note: if, on an initial packer leakage ten, a gas well is being flowed to the aumosphere due to the lack of a pijeline connection the flow period shall be three hours.
- 3. Following completion of Flow Ten No. 1, the well shall again be shut-in, in accordance with Paragraph 3 shove.
- C. Fire Test No. 2 shall be conducted even though no leak was indicated during Flow Test No. 3, 5, 10, 10, 10 for Flow Test No. 3 min by the same as for Flow Test No. 3 except

- that the previously produced zone shall remain shut-in while the zone which was pr ly shut-in is produced.
- 7. Pressures for gat-sone tests must be measured on each sone with a dear pressure gauge at time intervals at follows: 3 hours tests: immediately prior to the ing of each flow-period, at fineen-minute intervals during the first how thereof, hourly intervals thereafter, including one pressure measurement immediately prior conclusion of each flow period. 7-day tests: immediately prior to the beginning flow period, at least one time during each flow period (at approximately the point) and immediately prior to the trunclusion of each flow period. Other pressure taken as desired, or may be requested on wells which have previously show

tionable test data.

24-hour oil sone tests: all pressures, throughout the entire test, shall be continued and seconded with recording pressure gauges the accuracy of which therefore at least rwice, once at the beginning and once at the end of each test deadweight pressure gauge. If a well is a gas-oil or an oil-gra dual completion, the long gauge shall be required on the oil sone only, with deadweight pressures as above being taken on the gra sone.

8. The results of the above-described tests shall be filed in triplease within 13 d templetion of the test. Tests thall be filed with the Aster Diracir Office of the No. Dil Conservation Diracion on Northwest New Mexico Parket Leskage Test Form 10-01-78 with all deadweight pressures indicated thereon as well as the temperatures (gas zones only) and gravity and GOR (oil zones only).
