NORTHWEST NEW MEXICO PACKER LEAKAGE TEST INSTRUCTIONS

1. A pacter leakage test shall be commenced on each southiply completed well within seven days after sexual completion of the well, and annually thereafter as prescribed by the order authorizing the multiple completion. Such tests shall also be commenced on all multiple completions within seven days following recompletion and/or chemical or fracture treatment, and whenever remedial work has been done on a well during which the packer or the rubing have been disturbed. Tests shall also be taken at any time that communication is suspected or when requested by the Division.

Commenced at Shour, date) ##

- 2. At least 72 hours prior to the commencement of any pother leahage test, the operator shall notify the Division in writing of the exact time the test is to be anomenced. Offset operators shall also be so notified.
- 3. The packer leakage test shall commence when both sones of the dual completion are shur-in for pressure stabilization. Both sones shall remain shur-in until the well-head pressure in each has stabilized, provided however, that they need not remain shur-in more than seven days.
- 4. For Flow Test No. 1, one zone of the dual completion shall be produced at the normal rate of production while the other zone remains shut-in. Such our shall be continued for seven days in the case of a gas well and for 24 hours in the case of an oil well. Note: if, on an initial pather leskage test, a gas well is being flowed to the samesphere due to the lack of a populine connection the flow period shall be three hours.
- 5. Following completion of Flow Test No. 1, the well shall again be shot-in, in accordance with Purigraph 3 above, $\frac{1}{2}$
- Flow Your'No. 2 shall be conducted even though no lesh was indicated during Flow Test No. 1. Procedure for Flow Test No. 2 is to be the same to far Flow Test No. 1 except

- that the previously produced zone shall remain shut-in while the zone which was previously shut-in is produced.
- 7. Pressures for gas-sone tests must be measured on each sone with a deadweight pressure gauge at time intervals as follows: 3 hours tests: immediately prior to the beginning of each flow-period, at lifeten-minute intervals during the first hour thereof, and at hourly intervals theseafter, including one pressure measurement immediately prior to the conclusion of each flow period, 7-day same: immediately prior to the beginning of each flow period, at least one time duting each flow period (at approximately the midway point) and immediately prior to the enactuation of each flow period. Other pressures may be taken as desired, or may be requested on wells which have previously shown questionable test data.

24-hour oil sone tests: all pressures, throughout the entire test, shall be continuously measured and recorded with recording pressure gauges the accuracy of which must be checked at least review, once at the beginning and once at the end of each test, with a deadweight pressure gauge. If a well is a gas-oil or an oil-gas dual completion, the recording gauge shall be required on the oil zone only, with deadweight pressures as required above being taken on the gas sone.

8. The results of the above-described sess shall be filed in triplicate within 15 days after completion of the test. Tests shall be filed with the Astoc District Office of the New Mesico Oil Conservation Division on Northwest New Mesico Packer Leskage Test Form Revised 10-01-78 with all deadweight premiures indicated thereon as well as the flowing temperatures (gas seems only) and gravier and GOR (oil seems only).
