NORTHWEST NEW MEXICO PACKER LEAKAGE TEST INSTRUCTIONS

- 1. A packer leakage test shall be commenced on their multiply completed well within seven days after except that the previously produced zone shall remain shut-in while the zone which actual completion of the well, and annually thereafth as prescribed by the order authorizing the multiple completion. Such tests shall also be consisted on all multiple completions within seven days following recompletion and/or chemical or fract-task treatment, and whatever remedial work has been done on a well during which the pucker or the tubility haive man disturbed. Tests shall also be taken at
- any time that communication is suspected or when the property of the Division.

 2. At least 72 hours prior to the commencement of any packer leakage jest, the operator shall netify the Division in writing of the exact time the test is no bis commenced. Offset operators shall also be so notified.
- 3. The packer leakage test shall commence when both zones of the dual completion are shut-in for
- pressure stabilization. both zones shall remain shap-in until the well-hold pressure in each has stabilized, provided however, that they need not remain shar-in more than seven days.

 4. For flow Test No. 1, one zone of the dual completion shall be produced at the normal rate of production while the other zone remains shall-in. Such test shall be confinued for seven days if the case of a gas well and for 24 hours in the case of an oil well. Note: if, on an initial packer leakage test, a gas well is being flowed to the atmosphere due to the back of a pipeline connection the flow period shall be three hours.
- 5. Following completion of flow Test No. 1, the well shall again be ship-in. in accordance with
- 6. Flow Test No. 2 shall be conducted even though no leak was indicated during flow Test No. 1. Procedure for Flow Test No. 2 is to be the same as for Flow Test No. \$

and the second of the second o

- was previously shat-in is produced.
- 7. Pressures for as-zone tests must be measured on each zone with a deadweight pressure gauge at time intervals as follows: 3 hours tests: immediately prior to the beginning of each flow-period, at fifteen minute intervals during the first hour thereof, and at hapirly intervals thereafter, including one pressure measurement immediately prigrato the flow period, at least one time during each flow period (at approximately the midway point) and immediately prior to the conclusion of each flow period. Other pressures may be taken as desired, or may be requested on wells which have previously shown questionable test data.
- 24-hour oil zone pens: all pressures, throughout the entire test, shall be continuously medianed and recorded with recording pressure gauges the accuracy of which must be classified at least twice, once at the beginning and once at the erc of each test, with a disadweight pressure gauge. If a well is a gas-oil or an oil-gas dual completion, the seconding gauge shall be required on the oil zone only, with deadweight pressures as required above being taken on the gaz zone.

 8. The results of the above described tests shall be filed in triplicate within 15 days. deadweight press
- after completion of the test. Tests shall be filed with the Aztec District Office of the New Mexico Cil Conservation Division of Northwest New Mexico Packet Leakage Test form Revised 10/01/78 with all deadweight pressures indicated thereon as well as the flowing temperatures (gas zones only) and gravity and GOR (oil zones only).
