Hubbell A #1

Dakota

1180' FNL & 1560' FEL

Unit B, Section 29, T28N, R10W

Latitude / Longitude: 36° 38.2269'/ 107° 54.8822' DPNO: 29935

Tubing Repair Procedure

Project Summary: The Hubbell A #1 will not unload fluids. We propose to pull the tubing, check for fill, replace any worn or scaled tubing and install a plunger lift. The tubing will be lowered 150'. The Hubbell A #1 was drilled in 1961 and tubing has not been pulled since originally placed.

- 1. Hold safety meeting. Comply with all NMOCD, BLM and Burlington safety and environmental regulations. Test rig anchors and build blow pit prior to moving in rig. Notify BROG Regulatory (Peggy Bradfield 326-9727) and the appropriate Regulatory Agency prior to pumping any cement job. If an unplanned cement job is required, approval is required before the job can be pumped. If verbal approval is obtained, document approval in DIMS/WIMS. Allow as much time as possible prior to pump time in case the Agency decides to witness the cement job.
- 2. MOL and RU workover rig. Obtain and record all wellhead pressures. NU relief line. Blow well down and kill with 2% KCL water if necessary. NU BOP with stripping head. Test and record operation of BOP rams. Have wellhead and valves serviced as necessary. Test secondary seal and replace/install as necessary.
- The Dakota tubing is 2-3/8", 4.7#, J-55 set at 6475". Release donut, pick up additional joints of 3. tubing and tag bottom (record depth.) PBTD should be at +/- 6666. TOOH with tubing. Visually inspect tubing for corrosion and replace any bad joints. Check tubing for scale build up and notify Operations Engineer.
- 4. If fill covers any perforations then TIH with 3-7/8" bit and a watermelon mill on 2-3/8" tubing to below perforations, cleaning out with air/mist. NOTE: When using air/mist, minimum mist rate is 12 bph.
- 5. PU above the perforations and flow the well naturally, making short trips for clean up when necessary. TOOH with tubing. TIH with one joint of 2-3/8" tubing with an expendable check on bottom and a seating nipple one joint off bottom. Run a broach on sandline to insure that the tubing is clear. Land tubing at approximately 6620'. ND BOP and NU WH. Pump off expendable check. Connect to casing and circulate air to assure that expendable check has pumped off. If well will not flow on it's own, make swab run to SN. RD and MOL. Return well to production.
