## NORTHWEST NEW MEXICO PACKER LEAKAGE TEST INSTRUCTIONS

Operator \_\_

Date \_\_\_

\_ 19 \_\_\_\_

1. A packer leakage test shall be commenced on each multiply completed well within seven days after acrual completion of the well, and annually thereafter as prescribed by the order authorizing the multiple completion. Such term shall also be commenced on all multiple completions within seven days following recompletion and/or chemical or fracruse treatment, and whenever remedial work has been done on a well during which the packet or the rubing have been distrathed. Tests shall also be taken at any time that communication is suspected or when requested by the Division.

MAY 1 6 1995

DEPUTY OIL & GAS INSPECTOR

New Mexico Oil Conservation Division

By \_\_

Tide

- 2. At least 72 hours prior to the commencement of any packer leakage test, the operator shall notify the Division in writing of the exact time the test is to be commenced. Offset operators shall also be so notified.
- 3. The packer leakage test shall commence when both zones of the dual completion are shut in for pressure stabilization. Both zones shall remain shut in until the well-head pressure in each has stabilited, provided however, that they need not remain short in more than seven days.
- 4. For Flow Test No. 1, one zone of the dual completion shall be produced at the normal rate of production while the other zone remains shut-in. Such test shall be continued for seven days in the case of a gas well and for 24 hours in the case of an oil well. Note: if, on an initial packer leakage test, a gas well is being flowed to the atmosphere due to the lack of a pipeline connection the flow period shall be three hours.
- 5. Following completion of Flow Test No. 1, the well shall again be shut-in, in accordance with Paragraph 3 above.
- 6. Flow Test No. 2 shall be conducted even though no leak was indicated during Flow Tent No. 1. Procedure for Flow Tent No. 2 is to be the same as for Flow Tent No. 1 except

that the previously produced zone shall remain shut in while the zone which was previously shut in is produced.

Field Tech

Amoco Production Company

7. Pressures for gas-2000 tests must be measured on each 2000 with a deadweight pressure gauge at time intervals at follows: 3 hours tests: immediately prior to the beginning of each flow period, at fifteen minute intervals during the first hour thereof, and at bourly intervals thereafter, including one pressure measurement immediately prior to the conclusion of each flow period. 7-day tests: immediately prior to the beginning of each flow period, at least one time during each flow period (at approximately the midway point) and unmediately prior to the coochision of each flow period. Other pressures may be taken as desired, or may be requested on wells which have previously shown questionable test data.

24-hour oil zone tests: all pressures, throughout the entire test, shall be continuously measured and recorded with recording pressure gauges the accuracy of which must be checked at least twice, once at the beginning and once at the end of each text, with a desdweight pressure gauge. If a well is a gas-oil or an oil-gas dual completion, the recording gauge shall be required on the oil 2000 only, with deadweight pressures as required above being taken on the gas zone.

8. The results of the above-described tests shall be filed in triplicate within 13 days after completion of the test. Tests shall be filed with the Azter District Office of the New Mexico Oil Conservation Division on Northwest New Mexico Packer Leakage Test Form Revised 10-01-78 with all deadweight pressures indicated thereon as well as the flowing temperatures (gas sones only) and gravity and GOR (oil zones only).
