NORTHWEST NEW MEXICO PACKER LEAKAGE TEST INSTRUCTIONS

- 1. A packer leakage test shall be commenced on each multiply completed well within seven days after actual completion of the well, and annually thereafter as prescribed by the order authorizing the multiple completion. Such tests shall also be commenced on all multiple completions within seven days following recompletion and/or chemical or fracture ueaturent; and whenever remedial work has been done on a well during which the packer or the tubing have been durinbed. Tests shall also be taken at any time that communication is suspected or when requested by the Division.
- 2. At least 72 hours prior to the commencement of any packer leakage test, the operator shall notify the Distribution writing of the exact finite the test is to be commenced. Offset operators shall also be so notified.
- 3. The packer leakage tent shall commence when both zones of the deal completion are shut-in for pressure stabilization. Both zones shall remain shut-in until the well-head pressure in each has stabilized, provided however, that they need not remain shut-in more than seven days.
- 4. For Flow Ten No. 1, one zone of the dual completion shall be produced at the normal rate of production while the other zone remains shut-in. Such ten shall be continued for seven days in the case of a partial and for 24 hours in the case of an oil well. Note: if, on an initial packer leakage tent, a partial is being flowed to the authorphere due to the lack of a psycline connection the flow period shall be three hours.
- 5. Following completion of Flow Test No. 1, the well shall again be shut-in, in accordance with Paragraph 3 above.
- C. Time Test No. 2 shall be conducted even though no leak was indicated during Fire Test No. 1 with 2 is to be the same as follow. Test No. 1 except

- that the previously produced zone shall remain shut-in while the zone which was previly shut-in is produced.
- 7. Pressures for gas-zone testi must be measured on each zone with a dead-pressure gauge at time intervals as follows: 3 hours testi: immediately prior to the Ling of each flow-period, at fifteen-minute intervals during the first hour thereof, hourly intervals thereafter, including one pressure measurement immediately prior conclusion of each flow period. 7-day testi: immediately prior to the beginning of flow period, at feath one time during each flow period (at approximately the ripoint) and immediately prior to the conclusion of each flow jeriod. Other pressure taken as desired, or may be requested on wells which have previously shown a topically test data.

24-hour oil zone text: all pressures, throughout the entire text, shall be continued and recorded with recording pressure gauges the accuracy of which must checked at least twice, once at the beginning and once at the end of each text, with deadweight pressure gauge. If a well is a gas-oil or an oil-gas dual completion, the reing gauge shall be required on the oil zone only, with deadweight pressure as relative being taken on the gas zone.

E. The results of the above-described term shall be filed in triplicate within 15 days completion of the term. Term shall be filed with the Azter District Office of the New A. Oil Conservation Division on Northwest New Mesko Facker Leakage Term Form A. 10-01-78 with all deadweight pressures indicated thereon as well as the facetomy termination (real zones only) and graving and GOR (oil zones only).
