NORTHWEST NEW MEXICO PACKER LEAKAGE TEST INSTRUCTIONS

1. A packer leakage test shall be commenced on each multiply completed well within seven days after actual completion of the well, and annually thereafter as prescribed by the order authorizing the multiple completion. Such tests shall also be commenced on all multiple completions within seven days following recompletion and/or chemical or fracture treatment, and whenever remedial work has been done on a well during which the packer or the tubing have been disturbed. Tests shall also be taken at any time that communication is suspected or when requenced by the Division.

Commenced at (hous, date) **

- 2. At least 72 linuts prior to the commencement of any packer leakage test, the operator shall notify the Division in writing of the exact time the test is to be commenced. Offset operators shall also be so notified.
- 3. The packer leakage rest shall commence when both zones of the dual completion are shur-in for pressure stabilization. Both zones shall remain shur-in until the well-head pressure in each his stabilized, provided however, that they need not remain shur-in more than seven days.
- 4. For Flow Test No. 1, one zone of the dual completion shall be produced at the normal rate of production while the other zone remains shut-in. Such test shall be continued for seven dast in the case of a pas well and for 24 hours in the case of an oil well. Note: if, on an initial packer leakage test, a gas well in being flowed to the atmosphere due to the lack of a pipeline connection the flow period shall be there hours.
- 3. Tolliwing completion of Flow Ten No. 1, the well shall again be shut-in, in accordance with Paragraph 3 above.
- 6 Pine Tent'No. 2 shall be conducted even though no leak was indicated during Fine Ten No. 1. Privadure for Fine Ten No. 2 is to be the same as for Fine Ten No. 1 except

- that the previously produced zone shall termain thut-in while the zone which was previously thut-in it produced.
- 7. Pressures for gas-some term must be measured on rath zone with a deadweight pressure gauge at time intervals as follows: 3 hours tests: immediately prior to the beginning of each flow-period, at fifteen-minute intervals during the first hout thereof, and at hourly intervals thereafter, including one pressure measurement immediately prior to the conclusion of each flow period. 7-day term: immediately prior to the beginning of each flow period, at least one time during each flow period (at approximately the midway point) and immediately prior to the terrelusion of each flow period. Other pressures may be taken as desired, or may be requested on wells which have previously shown ques-
- 24-hour oil some term: all pressures, throughout the entire tert, shall be continuously measured and seconded with recording pressure gauges the measurer of which must be checked at least rwice, once at the beginning and once at the end of each tert, with a deadweight pressure gauge. If a well is a gas-oil or an oil-gas dual completion, the recording gauge shall be required on the oil some only, with deadweight pressures as required above being taken on the gas some.
- 8. The serolu of the above described seau shall be filed in triplicate within 13 days afte completion of the tent. Tents shall be filed with the Astee District Office of the New Messer Oil Conversation Division on Northwest New Messer Packet Leakage Test form Review 10-01-78 with all deadweight pressures indicated thereon as well as the flown temperatures (gas zones only) and gravity and GOR foil zones only).
