NORTHWEST NEW MEXICO PACKER LEAKAGE TEST INSTRUCTIONS

1. A packer leakage test shall be commoned on each multiply completed well within seven days after actual completion of the well, and annually thereafter as prescribed by the order authorizing the multiple completion. Such tests shall also be commenced on all multiple completions within seven days following recompletion and/or chemical or fracture uncurrent, and whenever remedial work has been done on a well during which the packer or the tubing have been durunbed. Tests shall also be taken at any time that communication is nuspected or when requenced by the Division.

DEPUTY OIL & GAS INSPECTOR, DIST.

- 2. At least 72 hours prior to the commencement of any packer leakage test, the operator shall mittly the Diction in writing of the exact time the test is to be commenced. Offset operators shall also be so notified.
- 3 The parket leaving ten shall commence when both somes of the dual completion are thursen for pressure rasbilisation. Both somes shall termain shut-in until the well-head pressure in each has stabilised, provided however, that they need not remain shut-in more than seven days.
- 4. For Flow Ten No. 1, one some of the dual completion shall be produced at the normal rate of production while the other some termains shut-in. Such ten shall be continued for seven days in the case of a gas well and for 14 hours in the case of an oil well. Note: if, on an initial packet leakage tent, a gas well in being flowed to the aumorphere due to the lack of a pijedime connection the flow period shall be three hours.
- 3. Following completion of Now Test No. 1, the well shall again be shut-in, in secondance with Paragraph 3 shove.
- (Fire Ter No. 2 stall be conducted even though no leak was indicated during Flow Transfer 1, Firefour for the control 2 is to be the same as for flow Territories.

- that the previously produced zone shall remain shur-in while the zone which was prely shur-in is produced.
- 7. Pressures for gas-sont seru must be measured on each sone with a deadpressure gauge at time intervals as follows: 3 hours seru: immediately prior to the leing of each flow-period, at fineen-minute intervals during the furst how thereof, a
 hourly intervals thereafter, including one pressure measurement immediately prior to
 conclusion of each flow period. 7-day term: immediately prior to the beginning of
 flow period, at least one time during each flow period (at approximately the m
 point) and immediately prior to the conclusion of each flow period. Other pressure
 be taken as desired, or may be requested on wells which have previously shown

tionable test data.

24-hour oil sone teru: all pressures, throughout the entire tert, shall be continued and recorded with recording pressure gauges the accuracy of which measured and lean rwice, once at the beginning and once at the end of each tert, deadweight pressure gauge. If a well is a gas-oil or an oil-gas dual completion, the sing gauge shall be required on the oil sone only, with deadweight pressures as to above being taken on the gas sone.

8. The results of the showed-mailed tests shall be filed in triplicate within 15 do completion of the ten. Term shall be filed with the Arter Dursies Office of the New Oil Conservation Division on Northwest New Mexico Parker Lexkage Ten Form 10-01-78 with all desdweight pressures indicated thereon as well as the temperatures (gas some only) and graving and GOR (oil some only).
